Preface

The described hard- and software are developments of the KEB Automation KG. The enclosed documents correspond to conditions valid at printing. Misprint, mistakes and technical changes reserved.

Signal words and symbols

Certain operations can cause hazards during the installation, operation or thereafter. There are safety informations in the documentation in front of these operations. Security signs are located on the device or machine. A warning contains signal words which are explained in the following table:

 DANGER	Dangerous situation, which will cause death or serious injury in case of non-observance of this safety instruction.
 WARNING	Dangerous situation, which may cause death or serious injury in case of non-observance of this safety instruction.
 CAUTION	Dangerous situation, which may cause minor injury in case of non-observance of this safety instruction.
NOTICE	Situation, which can cause damage to property in case of non-observance.

RESTRICTION

Is used when certain conditions must meet the validity of statements or the result is limited to a certain validity range.

Is used when the result will be better, more economic or trouble-free by following these procedures.

More symbols

- ▶ This arrow starts an action step.
- / - Enumerations are marked with dots or indents.
- => Cross reference to another chapter or another page.

Note to further documentation.

PREFACE

Laws and guidelines

KEB Automation KG confirms with the EC declaration of conformity and the CE mark on the device nameplate that it complies with the essential safety requirements.

The EC declaration of conformity can be downloaded on demand via our website. Further information is provided in chapter "Certification".

Warranty and liability

The warranty and liability on design, material or workmanship for the acquired device is given in the general sales conditions.

Here you will find our general sales conditions.
www.keb.de/terms-and-conditions

Further agreements or specifications require a written confirmation.

Support

Through multiple applications not every imaginable case has been taken into account. If you require further information or if problems occur which are not treated detailed in the documentation, you can request the necessary information via the local KEB Automation KG agency.

The use of our units in the target products is outside of our control and therefore lies exclusively in the area of responsibility of the customer.

The information contained in the technical documentation, as well as any user-specific advice in spoken and written and through tests, are made to best of our knowledge and information about the intended use. However, they are regarded as being only informal and changes are expressly reserved, in particular due to technical changes. This also applies to any violation of industrial property rights of a third-party. Selection of our units in view of their suitability for the intended use must be done generally by the user.

Tests can only be done within the intended end use of the product (application) by the customer. They must be repeated, even if only parts of hardware, software or the unit adjustment are modified.

Copyright

The customer may use the instructions for use as well as further documents or parts from it for internal purposes. Copyrights are with KEB Automation KG and remain valid in its entirety.

This KEB product or parts thereof may contain third-party software, including free and/or open source software. If applicable, the license terms of this software are contained in the instructions for use. The instructions for use are already available to you, can be downloaded free of charge from the KEB website or can be requested from the respective KEB contact person.

Other wordmarks or/and logos are trademarks (™) or registered trademarks (®) of their respective owners.

4.3 Series connection cooling circuit.....	51
4.3.1 General instructions	51
4.3.2 Connection diagram series connection cooling circuit	52
4.4 Parallel connection of the coolant circuit.....	53
4.4.1 General instructions	53
4.4.2 Connection scheme parallel connection of the cooling circuit.....	53
5 Operation of liquid-cooled devices	54
5.1 General information	54
5.1.1 Pressure in the liquid cooler	54
5.1.2 Material of the heat sink	54
5.1.3 Materials in the cooling circuit	55
5.1.4 Requirements on the coolant	56
5.1.5 Requirements for open and half-open cooling systems	57
5.1.6 Coolant temperature.....	57
5.1.7 Moisture condensation	57

5.1.8 Supply of temper coolant.....	58
5.2 Diagrams of the cooling design	59
5.2.1 Pressure drop aluminium extrusion casting heat sink.....	59
5.2.2 Pressure drop aluminium heat sink with stainless steel tubes	60
5.2.3 Series connection of liquid coolers.....	61
5.2.4 Parallel connection of liquid coolers.....	62
6 Electrical Installation.....	63
6.1 General information	63
6.1.1 Wiring	63
6.1.2 Connection of the shield connection	64
6.1.3 Connection of the protective earth	64
6.2 Connection terminals power unit.....	65
6.2.1 Permitted cable cross-sections and tightening torques of the terminals	65
6.2.2 External fan power supply.....	66
6.3 Mains connection	67
6.3.1 Note about hard mains	67
6.3.2 Recommended type of mains cable.....	67
6.4 Motor connection	68
6.4.1 General instructions	68
6.4.2 Selection of the motor cable.....	68
6.4.3 Recommended type of the motor cable	69
6.4.4 Connection of the motor	69
6.4.5 Calculation of the motor voltage.....	69
6.4.6 Cable cross-sections	70
6.4.7 Motor cable lengths	71
6.5 DC connection	72
6.5.1 General instructions	72
6.6 Temperature detection T1, T2.....	73
6.6.1 Use of the temperature input in KTY mode	74
6.6.2 Use of the temperature input in PTC mode.....	74
6.7 Connection of a braking resistor	75
6.7.1 Monitoring braking transistor	76
6.7.2 External braking resistor without temperature monitoring	76
6.7.3 External braking resistor with overtemperature protection	77
6.7.4 Sub-mounted braking resistors without overtemperature protection.....	77
6.8 Temperature switch braking resistor, mains and motor choke	77
6.8.1 General instructions	77
6.8.2 Parameterization of the control board	77
6.9 Connection of the master/slave wiring.....	78
6.9.1 Connection master/slave.....	78
6.9.2 Connection master/slave/slave.....	80

TABLE OF CONTENTS

Glossary

0V	Earth-potential-free common point	Endat	Bidirectional encoder interface of the company Heidenhain
1ph	1-phase mains	EtherCAT	Real-time Ethernet bus system of the company Beckhoff
3ph	3-phase mains	Ethernet	Real-time bus system - defines protocols, plugs, types of cables
AC	AC current or voltage	FE	Functional earth
AFE	From 07/2019 AIC replaces the previous name AFE	FSoE	Functional Safety over Ethernet
AFE filter	From 07/2019 AIC filter replaces the previous name AFE filter	FU	Drive converter
AIC	Active Infeed Converter	GND	Reference potential, ground
AIC filter	Filter for Active Infeed Converter	GTR7	Braking transistor
Application	The application is the intended use of the KEB product	HF filter	High frequency filter to the mains
ASCL	Asynchronous sensorless closed loop	Hiperface	Bidirectional encoder interface of the company Sick-Stegmann
Auto motor ident.	Automatically motor identification; calibration of resistance and inductance	HMI	Human machine interface (touch screen)
AWG	American wire gauge	HSP5	Fast, serial protocol
B2B	Business-to-business	HTL	Incremental signal with an output voltage (up to 30V) -> TTL
BiSS	Open source real-time interface for sensors and actuators (DIN 5008)	IEC	International standard
CAN	Fieldbus system	IP xx	Degree of protection (xx for level)
CDF	Cyclic duration factor	KEB product	The KEB product is subject of this manual
CDM	Complete drive module including auxiliary equipment (control cabinet)	KTY	Silicium temperature sensor (polarized)
COMBIVERT	KEB drive converters	Manufacturer	The manufacturer is KEB, unless otherwise specified (e.g. as manufacturer of machines, engines, vehicles or adhesives)
COMBIVIS	KEB start-up and parameterizing software	MCM	American unit for large wire cross sections
Customer	The customer has purchased a KEB product from KEB and integrates the KEB product into his product (customer product) or resells the KEB product (dealer)	Modulation	Means in drive technology that the power semiconductors are controlled
DC	DC current or voltage	MTTF	Mean service life to failure
DI	Demineralized water, also referred to as deionized (DI) water	NN	Sea level
DIN	German Institut for standardization	OC	Overcurrent
DS 402	CiA DS 402 - CAN device profile for drives	OH	Overheat
EMC	Electromagnetic compatibility	OL	Overload
Emergency stop	Shutdown of a drive in emergency case (not de-energized)	OSSD	Output signal swithcing device; - an output signal that is checked in regular intervals on its shutdown. (safety technology)
Emergency switching off	Switching off the voltage supply in emergency case	PDS	Power drive system incl. motor and measuring probe
EMS	Energy Management System	PE	Protective earth
EN	European standard	PELV	Protective Extra Low Voltage
Encoder emulation	Software-generated encoder output	PFD	Term used in the safety technology (EN 61508-1...7) for the size of error probability
End customer	The end customer is the user of the customer product		

GLOSSARY

PFH	Term used in the safety technology (EN 61508-1...7) for the size of error probability per hour
PLC	Programmable logic controller
PT100	Temperature sensor with $R_0=100\Omega$
PT1000	Temperature sensor with $R_0=1000\Omega$
PTC	PTC-resistor for temperature detection
PWM	Pulse width modulation
RJ45	Modular connector with 8 lines
SCL	Synchronous sensorless closed loop
SELV	Safety Extra Low Voltage (<60V)
SIL	The security integrity level is a measure for quantifying the risk reduction. Term used in the safety technology (EN 61508 -1...7)
SS1	Safety function „Safe stop 1“ in accordance with IEC 61800-5-2
SSI	Synchronous serial interface for encoder
STO	Safety function „Safe Torque Off“ in accordance with IEC 61800-5-2
TTL	Incremental signal with an output voltage up to 5V
USB	Universal serial bus
VARAN	Real-time Ethernet bus system

Standards for drive converters / control cabinets

Product standards that apply directly to the drive converter

EN61800-2	Adjustable speed electrical power drive systems - Part 2: General requirements - Rating specifications for low voltage adjustable frequency a.c. power drive systems (VDE 0160-102, IEC 61800-2)
EN61800-3	Speed-adjustable electrical drives. Part 3: EMC requirements and specific test methods (VDE 0160-103, IEC 61800-3)
EN61800-5-1	Adjustable speed electrical power drive systems - Part 5-1: Safety requirements - Electrical, thermal and energy (IEC 61800-5-1); German version EN 61800-5-1
EN61800-5-2	Adjustable speed electrical power drive systems - Part 5-2: Safety Requirements - Functional (IEC 22G/264/CD)
UL61800-5-1	American version of the EN61800-5-1 with „National Deviations“

Basic standards to which drive converter standards refer directly

EN 55011	Industrial, scientific and medical equipment - Radio frequency disturbance characteristics - Limits and methods of measurement (CISPR 11); German version EN 55011
EN 55021	Interference to mobile radiocommunications in the presence of impulse noise - Methods of judging degradation and measures to improve performance (IEC/ CISPR/D/230/FDIS); German version prEN 55021
EN 60529	Degrees of protection provided by enclosures (IP Code) (IEC 60529)
EN 60664-1	Insulation coordination for equipment within low-voltage systems Part 1: Principles, requirements and tests (IEC 60664-1)
EN 60721-3-1	Classification of environmental conditions - Part 3-1: Classification of groups of environmental parameters and their severities - Section 1: Storage (IEC 60721-3-1); German version EN 60721-3-1
EN 60721-3-2	Classification of environmental conditions - Part 3: Classification of groups of environmental parameters and their severities - Section 2: Transportation and handling (IEC 104/670/CD)
EN 60721-3-3	Classification of environmental conditions - Part 3: Classification of groups of environmental parameters and their severities; section 3: Stationary use at weatherprotected locations; Amendment A2 (IEC 60721-3-3); German version EN 60721-3-3
EN 61000-2-1	Electromagnetic compatibility (EMC) - Part 2: Environment - Section 1: Description of the environment - Electromagnetic environment for low-frequency conducted disturbances and signalling in public power supply systems
EN 61000-2-4	Electromagnetic compatibility (EMC) - Part 2-4: Environment; Compatibility levels in industrial plants for low-frequency conducted disturbances (IEC 61000-2-4); German version EN 61000-2-4
EN 61000-4-2	Electromagnetic compatibility (EMC) - Part 4-2: Testing and measurement techniques - Electrostatic discharge immunity test (IEC 61000-4-2); German version EN 61000-4-2
EN 61000-4-3	Electromagnetic compatibility (EMC) - Part 4-3: Testing and measurement techniques - Radiated, radio-frequency, electromagnetic field immunity test (IEC 61000-4-3); German version EN 61000-4-3
EN 61000-4-4	Electromagnetic compatibility (EMC) - Part 4-4: Testing and measurement techniques - Electrical fast transient/burst immunity test (IEC 61000-4-4); German version EN 61000-4-4

STANDARDS FOR DRIVE CONVERTERS/CONTROL CABINETS

EN61000-4-5	Electromagnetic compatibility (EMC) - Part 4-5: Testing and measurement techniques - Surge immunity test (IEC 61000-4-5); German version EN 61000-4-5
EN61000-4-6	Electromagnetic compatibility (EMC) - Part 4-6: Testing and measurement techniques - Immunity to conducted disturbances, induced by radio-frequency fields (IEC 61000-4-6); German version EN 61000-4-6
EN61000-4-34	Electromagnetic compatibility (EMC) - Part 4-34: Testing and measurement techniques - Voltage dips, short interruptions and voltage variations immunity tests for equipment with mains current more than 16 A per phase (IEC 61000-4-34); German version EN 61000-4-34
EN61508-1...7	Functional safety of electrical/electronic/programmable electronic safety-related systems – Part 1...7 (VDE 0803-1...7, IEC 61508-1...7)
EN62061	Safety of machinery - functional safety of electrical, electronic and programmable electronic safety-related systems (VDE 0113-50, IEC 62061)
EN ISO 13849-1	Safety of machinery - safety-related parts of control systems - Part 1: General principles for design (ISO 13849-1); German version EN ISO 13849-1

Standards that are used in the environment of the drive converter

DGUV regulation 3	Electrical installations and equipment
DIN 46228-1	Wire-end ferrules; Tube without plastic sleeve
DIN 46228-4	Wire-end ferrules; Tube with plastic sleeve
DIN IEC 60364-5-54	Low-voltage electrical installations - Part 5-54: Selection and erection of electrical equipment - Earthing arrangements, protective conductors and protective bonding conductors (IEC 64/1610/CD)
DIN VDE 0100-729	Low-voltage electrical installations - Part 7-729: Requirements for special installations or locations - Operating or maintenance gangways (IEC 60364-7-729:2007, modified); German implementation HD 60364-7-729:2009
DNVGL-CG-0339	Environmental test specification for electrical, electronic and programmable equipment and systems
EN 1037	Safety of machinery - Prevention of unexpected start-up; German version EN 1037
EN 12502-1...5	Protection of metallic materials against corrosion - Part 1...5
EN 60204-1	Safety of machinery - electrical equipment of machines Part 1: General requirements (VDE 0113-1, IEC 44/709/CDV)
EN 60439-1	Low-voltage switchgear and controlgear assemblies - Part 1: Type-tested and partially type-tested assemblies (IEC 60439-1); German version EN 60439-1
EN 60947-7-1	Low-voltage switchgear and controlgear - Part 7-1: Ancillary equipment - Terminal blocks for copper conductors (IEC 60947-7-1:2009); German version EN 60947-7-1:2009
EN 60947-8	Low-voltage switchgear and controlgear - Part 8: Control units for built-in thermal protection (PTC) for rotating electrical machines (IEC 60947-8:2003 + A1:2006 + A2:2011)
EN 61373	Railway applications - Rolling stock equipment - Shock and vibration tests (IEC 61373); German version EN 61373
EN 61439-1	Low-voltage switchgear and controlgear assemblies - Part 1: General rules (IEC 121B/40/CDV); German version FprEN 61439-1
VGB R 455 P	Water treatment and use of materials in cooling systems
ISO 4017	Fasteners - Hexagon head screws - Product grades A and B
ISO 4762	Hexagon socket head cap screws
ISO 7090	Plain washers, chamfered - Normal series - Product grade A
ISO 7092	Plain washers - Small series - Product grade A
ISO 7045	Pan head screws with type H or type Z cross recess - Product grade A

1 Basic Safety Instructions

The COMBIVERT is designed and constructed in accordance with state-of-the-art technology and the recognised safety rules and regulations. However, the use of such devices may cause functional hazards for life and limb of the user or third parties, or damages to the system and other material property.

The following safety instructions have been created by the manufacturer for the area of electric drive technology. They can be supplemented by local, country- or application-specific safety instructions. This list is not exhaustive. Non-observance of the safety instructions by the customer, user or other third party leads to the loss of all resulting claims against the manufacturer.

NOTICE

Hazards and risks through ignorance.

- ▶ Read the instructions for use !
- ▶ Observe the safety and warning instructions !
- ▶ If anything is unclear, please contact KEB Automation KG !

1.1 Target group

This instruction manual is determined exclusively for electrical personnel. Electrical personnel for the purpose of this instruction manual must have the following qualifications:

- Knowledge and understanding of the safety instructions.
- Skills for installation and assembly.
- Start-up and operation of the product.
- Understanding of the function in the used machine.
- Detection of hazards and risks of the electrical drive technology.
- Knowledge of *DIN IEC 60364-5-54*.
- Knowledge of national safety regulations (e.g. *DGUV regulation 3*).

1.2 Transport, storage and proper use

The transport is carried out by qualified persons in accordance with the environmental conditions specified in this manual. Drive converter shall be protected against excessive strains.

Transport of drive converters with an edge length >75 cm

The transport by forklift without suitable tools can cause a deflection of the heat sink. This leads to premature aging or destruction of internal components.

- ▶ Transport of drive converters on suitable pallets.
- ▶ Do not stack drive converters or burden them with other heavy objects.

BASIC SAFETY INSTRUCTIONS

Drive converters contain electrostatic sensitive components.

- ▶ Avoid contact.
- ▶ Wear ESD-protective clothing.

Do not store drive converters

- in the environment of aggressive and/or conductive liquids or gases.
- with direct sunlight.
- outside the specified environmental conditions.

1.3 Installation

⚠ DANGER

Do not operate in an explosive environment!

- ▶ The COMBIVERT is not intended for the use in potentially explosive environment.

⚠ CAUTION

Maximum design edges and high weight!

Contusions and bruises!

- ▶ Never stand under suspended loads.
- ▶ Wear safety shoes.
- ▶ Secure drive converter accordingly when using lifting gear.

- To prevent damages to the device:
- Make sure that no components are bent and/or isolation distances are changed.
- The device must not be put into operation in case of mechanical defects. Non-compliance with the applicable standards.
- Do not allow moisture or mist to penetrate the unit.
- Avoid dust permeating the device. Allow for sufficient heat dissipation if installed in a dust-proof housing.
- Note installation position and minimum distances to surrounding elements. Do not cover the ventilation openings.
- Mount the drive inverter according to the specified degree of protection.
- Make sure that no small parts fall into the COMBIVERT during assembly and wiring (drilling chips, screws etc.). This also applies to mechanical components, which can lose small parts during operation.
- Check the reliable fit of the device connections in order to avoid contact resistances and sparking.
- Do not walk-on drive converter.
- The safety instructions are to be kept!

1.4 Electrical connection

⚠ DANGER

Voltage at the terminals and in the device!

Danger to life due to electric shock !

- ▶ Never work on the open device or never touch exposed parts.
- ▶ For any work on the unit switch off the supply voltage, secure it against switching on and check absence of voltage by measuring at the input terminals.
- ▶ Wait until all drives has been stopped in order that no regenerative energy can be generated.
- ▶ Await capacitor discharge time (5 minutes). Check absence of voltage by measuring at the DC terminals.
- ▶ If personal protection is required, install suitable protective devices for drive converters.
- ▶ Never bridge upstream protective devices (also not for test purposes).
- ▶ Connect the protective earth conductor always to drive converter and motor.
- ▶ Install all required covers and protective devices for operation.
- ▶ The control cabinet shall be kept closed during operation.
- ▶ Residual current: This product may cause a dc current in the protective earth conductor. When a residual current protective device (RCD) or a residual current monitoring device (RCM) is used for the protection against direct or indirect contact, only a RCD or RCM type B is permitted on the power supply side of this product.
- ▶ Drive converters with a leakage current $> 3.5 \text{ mA AC}$ current (10 mA DC current) are intended for a stationary connection. Protective earth conductors must be designed in accordance with the local regulations for equipment with high leakage currents according to *EN 61800-5-1*, *EN 60204-1* or *DIN IEC 60364-5-54*.

If personnel protection is required during installation of the system, suitable protective devices must be used for drive converters.

www.keb.de/fileadmin/media/Manuals/knowledge/04_techinfo/00_general/ti_rcd_0400_0002_gbr.pdf

Installations which include drive converter shall be equipped with additional control and protective devices in accordance with the relevant applicable safety requirements, e.g. act respecting technical equipment, accident prevention rules etc. They must always be complied with, also for drive converter bearing a CE marking.

BASIC SAFETY INSTRUCTIONS

For a trouble-free and safe operation, please pay attention to the following instructions:

- The electrical installation shall be carried out in accordance with the relevant requirements.
- Cable cross-sections and fuses must be dimensioned by the user according to the specified minimum/maximum values for the application.
- The wiring must be made with flexible copper cable for a temperature $> 75^{\circ}\text{C}$.
- Connection of the drive converter is only permissible on symmetrical networks with a maximum line voltage (L1, L2, L3) with respect to earth (N/PE) of max. 300 V. An isolating transformer must be used for supply networks which exceed this value! In case of non-compliance the control is not longer considered to be a PELV circuit.
- With existing or newly wired circuits the person installing the units or machines must ensure that the PELV requirements are met.
- For drive converters that are not isolated from the supply circuit (in accordance with [EN 60721-3-2](#)) all control lines must be included in other protective measures (e.g. double insulation or shielded, earthed and insulated).
- When using components without isolated inputs/outputs, it is necessary that equipotential bonding exists between the components to be connected (e.g. by the equipotential line). Disregard can cause destruction of the components by equalizing currents.

1.4.1 EMC-compatible installation

Observance of the limit values required by EMC law is the responsibility of the customer.

Notes on EMC-compatible installation can be found here.
www.keb.de/fileadmin/media/Manuals/emv/0000neb0000.pdf

1.4.2 Voltage test

Testing with AC voltage (in accordance with [EN 60204-1](#) chapter 18.4) may not be executed, since there is danger for the power semiconductors in the drive inverter.

Due to the radio interference suppression capacitors, the test generator will switch off immediately with a current fault.

According to [EN 60204-1](#) it is permissible to disconnect already tested components. Drive converters of the KEB Automation KG are delivered ex works voltage tested to 100% according to product standard.

1.4.3 Insulation measurement

An insulation measurement (in accordance with [EN 60204-1](#) chapter 18.3) with DC 500 V is permissible, if all power unit connections (grid-connected potential) and all control connections are bridged with PE. The insulation resistance of the respective device can be found in the technical data.

1.5 Start-up and operation

The drive converter must not be started until it is determined that the installation complies with the machine directive; Account is to be taken of [EN 60204-1](#).

⚠ WARNING

Software protection and programming!

Hazards caused by unintentional behavior of the drive!

- ▶ Check especially during initial start-up or replacement of the drive converter if parameterization is compatible to application.
- ▶ Securing a unit solely with software-supported functions is not sufficient. It is imperative to install external protective measures (e.g. limit switch) that are independent of the drive converter.
- ▶ Secure motors against automatic restart.

⚠ CAUTION

High temperatures at heat sink and coolant!

Burning of the skin!

- ▶ Cover hot surfaces safe-to-touch.
- ▶ If necessary, attach warning signs on the system.
- ▶ Before touching, check the surface and coolant lines.
- ▶ Before working let the unit cool down.

- During operation, all covers and doors shall be kept closed.
- Use only approved accessories for this device.
- Never touch terminals, busbars or cable ends.

If a drive converter with electrolytic capacitors in a DC link (see technical data) has not been in operation for more than one year, observe the following instructions.

www.keb.de/fileadmin/media/Manuals/knowledge/04_techinfo/00_general/ti_format_capacitors_0400_0001_gbr.pdf

NOTICE

Continuous operation (S1) with load > 60% or from a rated motor power of 55 kW!

Premature ageing of the electrolytic capacitors!

- ▶ Mains choke with $U_k = 4\%$ absolutely necessary.

BASIC SAFETY INSTRUCTIONS

Switching at the output

Switching between motor and drive converter is prohibited for single drives during operation as this may trigger the protection gear of the device. Function ,speed search' must be activated if switching can not be avoided. Speed search may only be triggered after closing the motor contactor (e.g. by switching the control release).

Connecting and disconnecting is permissible with multiple motor drives if at least 1 motor is running during the switch-over process. The drive converter must be dimensioned to the occurring starting currents.

The ,speed search' function must be activated if the motor is still running during a restart of the drive converter (mains on) (e.g. due to large rotating masses).

Switching an the input

For applications that require cyclic switching off and on of the drive converter, maintain an off-time of at least 5 min after the last switch on. If you require shorter cycle times please contact KEB Automation KG.

Short-circuit resistance

The drive converters are conditional short-circuit proof. After resetting the internal protection devices, the function as directed is guaranteed.

Exceptions:

- If an earth-leakage fault or short-circuit often occurs at the output, this can lead to a defect in the unit.
- If a short-circuit occurs during regenerative operation (2nd or 4th quadrant, regeneration into the DC link), this can lead to a defect in the unit.

1.6 Maintenance

The following maintenance work has to be carried out when required, but at least once per year by authorized and trained personnel. Check unit for loose screws and plugs and tighten if necessary.

- ▶ Check system for loose screws and plugs and tighten if necessary.
- ▶ Clean drive converter from dirt and dust deposits. Pay attention especially to cooling fins and protective grid of the fans.
- ▶ Examine and clean extracted air filter and cooling air filter of the control cabinet.
- ▶ Check the function of the fans of the drive converter. The fan must be replaced in case of audible vibrations or squeak.
- ▶ In the case of liquid-cooled drive converters a visual test of the cooling circuit for leaks and corrosion must be carried out. The cooling circuit must be completely empty if a unit shall be switched off for a longer period. The cooling circuit must be blown out additionally with compressed air at temperatures below 0°C.

1.7 Repair

In case of malfunction, unusual noises or smells inform a person in charge!

DANGER

Unauthorized exchange, repair and modifications!

Unpredictable malfunctions!

- ▶ The function of the drive converter is dependent on its parameterization. Never replace without knowledge of the application.
- ▶ Modification or repair is permitted only by KEB Automation KG authorized personnel.
- ▶ Only use original manufacturer parts.
- ▶ Infringement will annul the liability for resulting consequences.

In case of failure, please contact the machine manufacturer. Only the machine manufacturer knows the parameterisation of the used drive converter and can provide an appropriate replacement or induce the maintenance.

1.8 Disposal

Electronic devices of the KEB Automation KG are exclusively professional devices for further industrial processing (so-called B2B devices).

Manufacturers of B2B devices are obliged to take back and recycle devices manufactured after 14.08.2018. These devices may not be disposed at the collection centres of public sector disposal organisations.

If no deviating agreement has been made between the customer and KEB or no deviating mandatory legal regulation exists, KEB products marked in this way can be returned. Company and keyword to the return point can be taken from the list below. Shipping costs are paid by the customer. Thereupon the devices will be professionally recycled and disposed.

The entry numbers are listed country-specific in the following table. The corresponding KEB return addresses can be found on our website.

Withdrawal by	WEEE-Reg.-No.	Keyword
Austria		
KEB Automation GmbH	ERA: 51976	Stichwort „Rücknahme WEEE“
France		
RÉCYLUM - Recycle point	ADEME: FR021806	Mots clés „KEB DEEE“
Germany		
KEB Automation KG	EAR: DE12653519	Stichwort „Rücknahme WEEE“
Italy		
COBAT	AEE: (IT) 19030000011216	Parola chiave „Ritiro RAEE“

The packaging must be feed to paper and cardboard recycling.

2 Product Description

The F5/F6 series are drive converters optimized for operation at synchronous and asynchronous motors. The COMBIVERT can be equipped with a control board for the use in safety-related applications. Furthermore, it can be operated at different fieldbus systems. The control board has a system-overlapping operating concept.

The COMBIVERT meets the requirements of the Low-Voltage Directive. The harmonized standards of the series *EN 61800-5-1* for drive converters were used.

The COMBIVERT is a product of limited availability in accordance with *EN 61800-3*. This product may cause radio interference in residential areas. In this case the operator may need to take corresponding measures.

Depending on the version, the machine directive, EMC directive, Low Voltage Directive and other directives and regulations must be observed.

2.1 Specified application

The COMBIVERT serves exclusively for the control and regulation of three-phase motors. It is designed for the installation in electrical systems or machines.

The technical data as well as information concerning the supply conditions shall be taken from the nameplate and from the instructions for use and shall be strictly observed.

The used semiconductors and components of KEB Automation KG are developed and dimensioned for the use in industrial products.

Restrictions

If the KEB COMBIVERT F5 is used in machines, which work under exceptional conditions or if essential functions, life-supporting measures or an extraordinary safety step must be fulfilled, the necessary reliability and security must be ensured by the machine builder.

2.1.1 Residual risks

Despite intended use, the drive converter can assume unpredictable operating conditions in error case, wrong parameterization, due to faulty connection or improper intervention or repairs. This can be:

- Wrong direction of rotation
- Motor speed too high
- Motor runs into limitation
- Motor may still carry live current when at rest
- Automatic restart

2.2 Improper use

The operation of other electric consumers is prohibited and can lead to the destruction of the devices. The operation of our products outside the indicated limit values of the technical data leads to the loss of any liability claims.

2.3 Product features

These instructions for use describe the power circuits of the following units:

Unit type:	Drive converter
Series:	COMBIVERT F5/F6
Power range:	200...315 kW as Single Drive 400...560 kW as Master/Slave system 630...900 kW as Master/Slave/Slave system
Housing:	P

The COMBIVERT F5/F6 is characterized by the following features:

- Operation of three-phase asynchronous motors and three-phase synchronous motors
- Operating modes open-loop or closed-loop with and without speed feedback
- Fieldbus interface F5 is realized by operator
- Fieldbus interface F6 supports the following systems directly: EtherCAT, VARAN or CAN
- System-overlapping operating concept
- Wide operating temperature range
- Low switching losses due to IGBT - power unit
- Low noise development due to high switching frequencies
- **Different heat sink concepts**
 - Air cooler as built-in version
 - Air cooler as push-through version
 - Liquid cooler as built-in version
 - Liquid cooler as push-through version
 - Liquid cooler with stainless steel tubes as built-in version
- Easily replaceable fans
- Depending on the operating mode, the torque limits and s-curves are adjustable (to protect the gear box)
- General protective functions of the COMBIVERT series against overcurrent, over-voltage and overtemperature
- Analog and digital inputs and outputs
- Potential-free relay output
- Brake control and supply
- Motor protection by I^2t
- KTY, PT100 and PTC input
- Diagnostic interface

Table 7: Technical data of the 400V class - Single Drive

- 1) Restrictions when using HF filters.
- 2) Phase conductor grounded mains are only permissible without HF filters.
- 3) Fusing according to UL => *Protection of drive converters*.
- 4) The voltage at the motor is dependent on the series-connected units and on the control method.
- 5) The output frequency is to be limited in such way that 1/10 of the switching frequency is not exceeded. Devices with higher maximum output frequency are subject to export restrictions and are only available upon request.
- 6) Max. current before the OL2 function triggers.
- 7) With the regulated operating modes 5% are to be subtracted as control reserve.
- 8) Applies to rated input voltage 400 V, 25 °C ambient temperature.
- 9) Maximum additional chargeable capacity per module.
- 10) Data apply to a switching level for the braking transistor of 780 V DC.
- 11) => *Wiring Diagrams*. UL, C-UL E120782 UL508, CSA C22.2 No.14; UL1604 (class I, Division 2, Group A, B, C, D); 277V AC 8A, General use, 24VDC 6A, General use, B300, R300 250V AC / max. 2A, 24V DC / max. 2A (Pilot Duty).
- 12) 180% only at rated switching frequency.
- 13) The internal fans are switched off below the operating voltage range.
- 14) Only possible as DC version without precharging.
- 15) The use of stronger heat sink fans for adaption to the ambient conditions or at higher overload (180 %) is possible after consultation with KEB.
- 16) The specifications apply to devices without derating of the switching frequency.
- 17) The specifications only apply if there is parallelly no power output via the motor connection terminals U / V / W.

NOTICE

An input choke is absolutely necessary.

The technical data are for 2/4-pole standard motors. With other pole numbers the drive converter must be dimensioned onto the rated motor current. Contact KEB for special or medium frequency motors.

4 Mechanical Installation

4.1 Control cabinet installation

4.1.1 General instructions

To ensure the connection between master / slave systems, the distances between the modules may not be exceeded => "*Mounting distances*".

4.1.2 Mounting distances

Mounting distances	Dimension	Distance in mm	Distance in inch
	A	150	6
	B	100	4
	C	100	4
	D ¹⁾	50...230	2...9
	E	0	0
	F ²⁾	50	2
	Cabinet wall		
¹⁾ Max. distance for master/slave systems is given by the Sub-D connection between the modules. ²⁾ Distance to preceding elements in the cabinet door.			

Figure 7: Mounting distances

Installation of the drive converter

For reliable operation, the drive converter must be mounted without clearance on a smooth, closed, bare metal mounting plate.

4.1.3 Mounting instructions for control cabinet installation

KEB recommends to use the following mounting materials with the appropriate quality for mounting the drive converters.

Required material	Tightening torque
Screw M8 - 8.8	25 Nm 220 lb inch
Screw M10 - 8.8	50 Nm 442 lb inch
Washer 12 - 200 HV	—

Table 13: Mounting instructions for control cabinet installation

4.1.4 Optional mounting aids

Two mounting aids are available as an accessory. They are attached at the drive converter and by way this enables the transport by lifting devices.

Depending on the heat sink models, a mounting bracket or two eye bolts are available as assembly aids.

Heat sink	Liquid cooler	Air cooler
Mounting bracket	✓	✗
Eye bolts	✓	✓

The mounting bracket is directly mounted at the frame, the eye bolts are screwed into the rear wall on the face side.

Alternatively, in the air-cooled version, the eye bolts can also be screwed into the heat sink on the face side.

Further information about accessories => *“Assembly aids”*.

Figure 8: Optional mounting aids

MECHANICAL INSTALLATION

4.2 Cooling system

The KEB COMBIVERT in P housing is available with air and liquid cooling system.
The system manufacturer must ensure the dissipation of the power loss.

NOTICE

- ▶ When connecting the cooling circuit, it is essential to follow the instructions in chapter => "*Operation of liquid-cooled devices*".
- ▶ Even brief interruptions of the cooling circuit can destroy the device.

⚠ CAUTION

High temperatures at heat sink and coolant!

Burning of the skin!

- ▶ Cover hot surfaces in a touch-safe manner.
- ▶ Allow the device to cool down before carrying out any work.
- ▶ If necessary, attach warning signs to the system.
- ▶ Check the surface and coolant lines before touching them.

4.2.1 Air cooler

- The drive converter must be mounted vertically in the control cabinet.
- The connection terminals must be located on the bottom side.
- Sufficient ventilation of the device must be ensured by the system manufacturer.

Legend	
①	Air flow direction through the interior
②	Air flow direction at the heat sink
①	Cold air
②	Warm air

Figure 9: Ventilation

MECHANICAL INSTALLATION

4.2.2 Liquid cooling

- The liquid coolers are designed for the connection to an available cooling system.
- The dissipation of the power loss must be ensured by the machine builder.
- In order to avoid moisture condensation, the minimum inlet temperature may not decrease the ambient temperature.
- No aggressive coolant shall be used.
- Measures against contamination and calcination must be done externally.

4.2.3 Connection of the liquid cooling to the cooling system

- The connection to the cooling system can occur as closed or open cooling circuit.
- The connection to a closed cycle cooling circuit is recommended, because the danger of contamination of coolant is significantly lower.
- Preferably also a monitoring of the pH value of the coolant should be installed.
- Pay attention to a corresponding cable cross section at required equipotential bonding in order to avoid electro-chemical procedures.
- Other elements in the cooling circuit such as pumps, shut-off valves, ventilation etc. must be added according to the cooling system and the local conditions.
- Pay attention to flux direction and check tightness!

Extrusion casting heat sink

- Screw in the connecting duct according to the mounting instructions
(=> "*Connections to the coolant*").
- The connection to the coolant must be carried out with flexible, pressure-resistant hoses and secured with clamps.

Aluminium heat sink with pressed stainless steel tubes

- Connection to the cooling circuit can be made with the aid of function nuts
(=> "*Connections to the coolant*") and the use of elastic, pressure-resistant hoses.

Volume flow meter and temperature monitoring

The use of volume flow meters as well as temperature monitoring is recommended.

NOTICE

- A discontinuous mode is not recommended, this can lead to a reduction of the service life.
- The max. pressure in the cooling system may not exceed 10 bar.
- The cooling flow must always be started before starting the COMBIVERT.

4.3 Series connection cooling circuit

4.3.1 General instructions

- Does the drive converter system work at rated operation the execution of the coolant circuit can be carried out in a series circuit.
- It should be noted that the temperature is analog measured in the slave devices and an error signal is given digitally to the master.
- The coolant return flow should always be attached at the master in order to display real temperatures.
- The volume flow to be selected depends on the size of the device, the output current at rated operation and the resulting power loss for the drive converter system.
- The correlation between total power dissipation, volume flow and temperature difference are shown in the diagram "*Series connection of liquid coolers*" and must be within the recommended operational range.

NOTICE

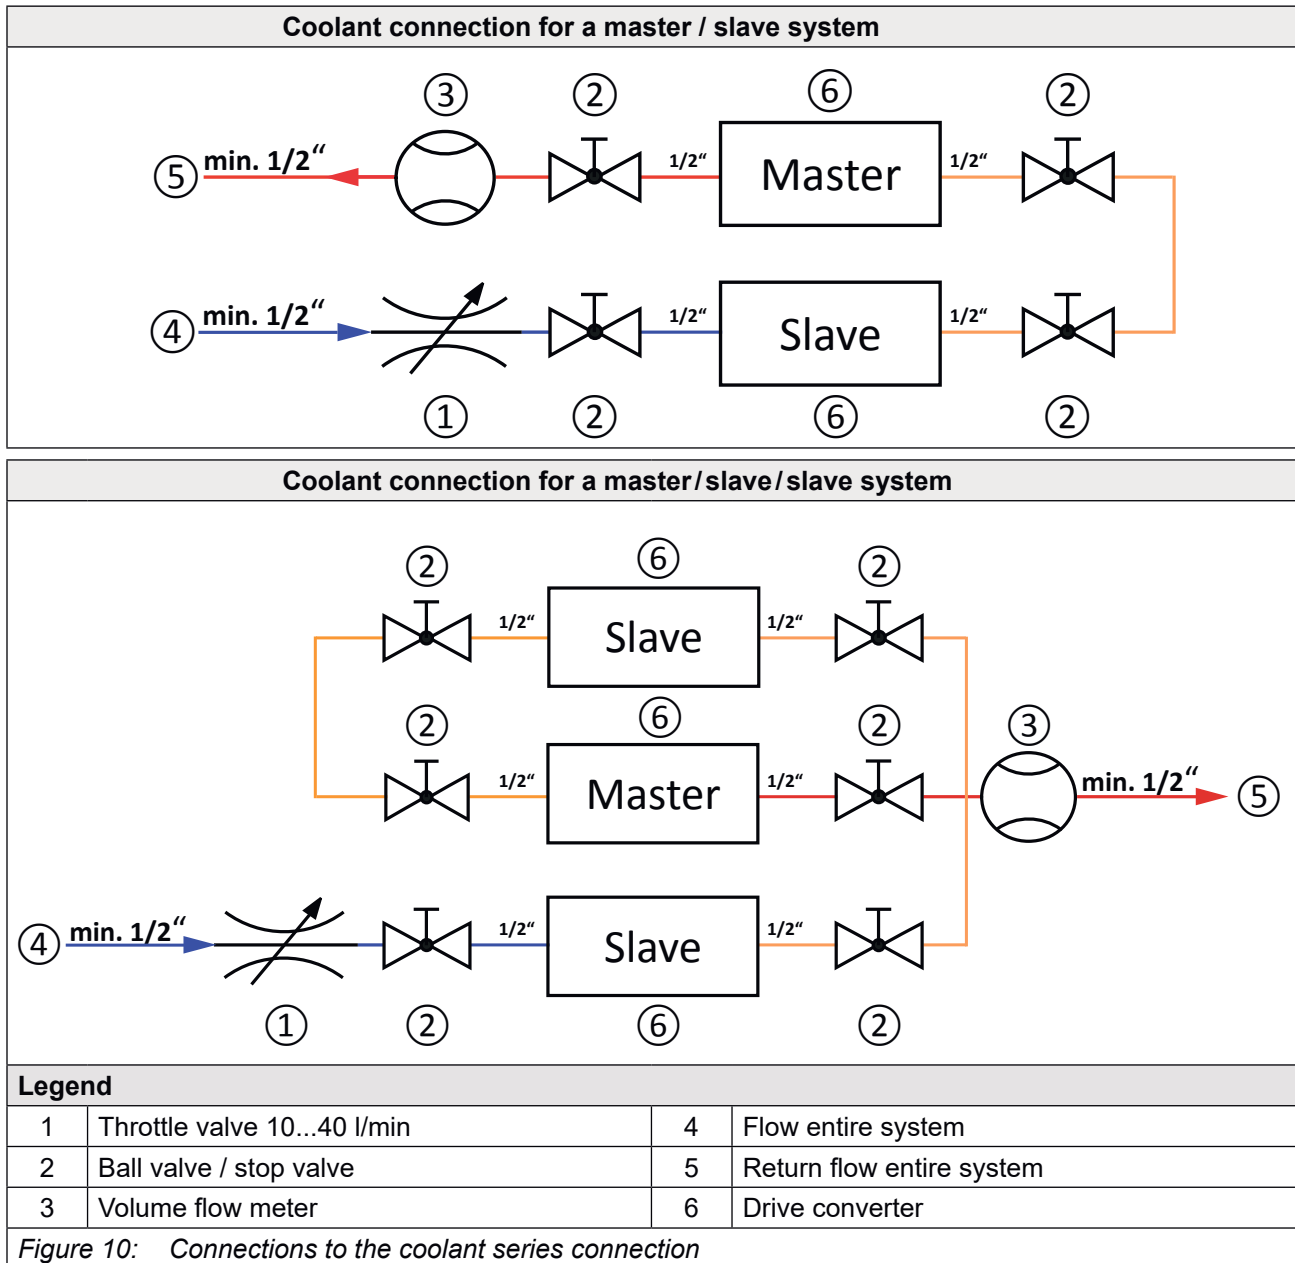

- The maximum temperature difference between flow and return flow must not be exceeded.
- If the volume flow (above 30 l/min) is selected too large, increases the risk of erosion in the liquid cooler.
- Series connection of liquid-cooled devices with stainless steel tubes is not permitted, since the total system pressure can increase above 10 bar.
- => "*Pressure drop aluminium heat sink with stainless steel tubes*".
- The cooling flow must always be started before starting the COMBIVERT.

MECHANICAL INSTALLATION

4.3.2 Connection diagram series connection cooling circuit

This connection scheme is only an installation proposal and does not replace professional planning and execution!

NOTICE

Only parallel connection of the coolant circuit is permissible for aluminum heat sinks with stainless steel tubes.

4.4 Parallel connection of the coolant circuit

4.4.1 General instructions

- The connection of the coolant circuit as a parallel version is also possible in rated operation. Mandatory for special applications.
- The total volume flow to be selected depends on the size of the device, the output current at rated operation and the resulting power dissipation for the drive converter system.
- The correlation between total power dissipation, volume flow and temperature difference are shown in the diagram *"Parallel connection of liquid coolers"* and must be within the recommended operational range.

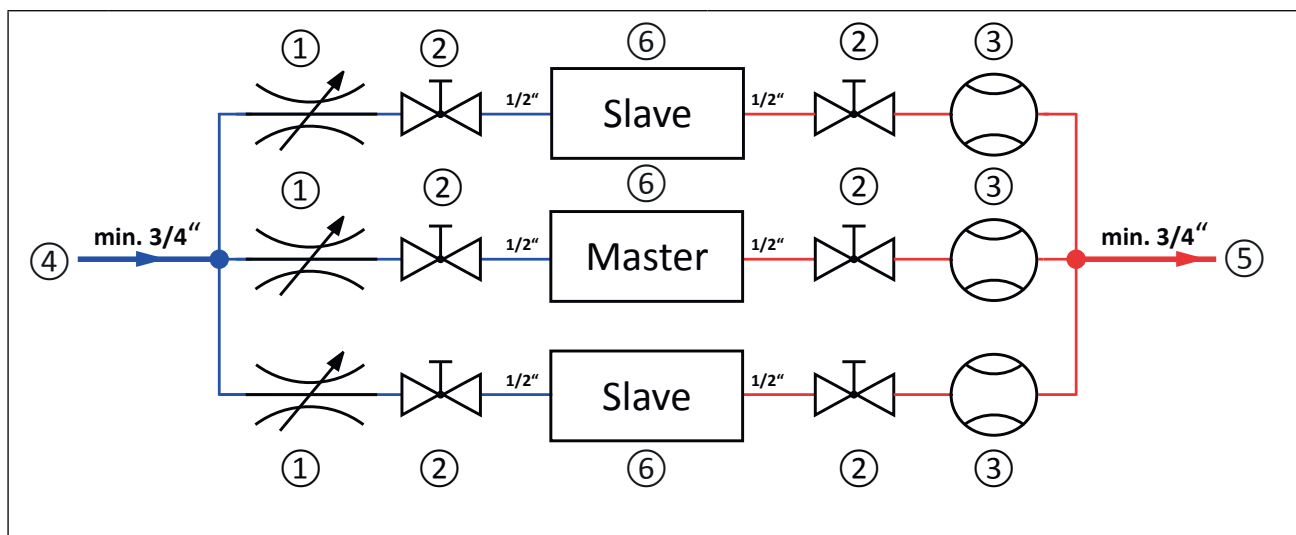

NOTICE

- The maximum temperature difference (ΔT) between flow and return flow may not exceed 7K.
- If the volume flow (above 30 l/min per module) is selected too large, increases the risk of erosion in the liquid cooler.
- The cooling flow must always be started before starting the KEB COMBIVERT.
- The use of a volume flow meter and a temperature monitoring is mandatory required.

4.4.2 Connection scheme parallel connection of the cooling circuit

This connection scheme is only an installation proposal and does not replace professional planning and execution!

Legend

1	Throttle valve 10...40l/min	4	Flow entire system
2	Ball valve / stop valve	5	Return flow entire system
3	Volume flow meter	6	Drive converter

Figure 11: Connections to the coolant parallel connection

5 Operation of liquid-cooled devices

5.1 General information

In continuous operation liquid-cooled drive converters are operated with lower temperature than air-cooled devices. This has positive effects on lifetime-relevant components such as fan and DC link circuit capacitors and power modules (IGBT). Also the temperature dependent switching losses are positively effected. The use of liquid-cooled COMBIVERT drive converters is offered in the drive technology, because there are process-caused coolants available with some applications.

5.1.1 Pressure in the liquid cooler

Concept of pressure	Value	Description
System test pressure	20 bar	Hydrostatic pressure used to test the integrity and tightness of the heat sink.
Operating pressure	=> "Diagrams of the cooling design"	Internal pressure that occurs at a certain point in time as a function of the volume flow in the heat sink.
Max. permissible operating pressure	10 bar	Highest temporary pressure, including pressure surge, which the heat sink will resist.

Table 14: Pressure in the liquid cooler

5.1.2 Material of the heat sink

Design system	Material (voltage)	Connection
Extrusion casting heat sink	Aluminium (-1.67V)	2xhose connection G1/2 with mounting nut
Aluminium heat sink with pressed pipes	Stainless steel (-1.04V)	Outer pipe diameter Ø 12 mm for 2xfunction nuts (optional)

Table 15: Heat sink and operating pressure

The aluminium liquid coolers are sealed with sealing rings and possess a surface protection (anodized) even in the ducts.

NOTICE

In order to avoid a deformation of the heat sink and the damages thereby, the indicated max. operating pressure may not be exceeded briefly also by pressure peaks.

5.1.3 Materials in the cooling circuit

- For all metallic elements in contact with the coolant (electrolyte) in the cooling circuit, select a material which generates a low voltage difference to the heat sink (see electrochemical voltage series). This prevents contact corrosion and/or pitting corrosion.
- Other materials must be examined in each case before employment.
- The specific case of application must be checked by the customer in tuning of the complete cooling circuit and must be classified according to the used materials.
- With hoses and seals take care that halogen-free materials are used.

- For liquid coolers with stainless steel tube, we recommend the use of stainless steel or nickel plated brass cable glands.
- For liquid coolers as extrusion casting heat sink, we recommend the use of aluminium or ZnNi coated steel tubes.

NOTICE

A liability for occurring damages by wrongly used materials and from this resulting corrosion is not taken over!

Electro-chemical voltage series / standard potentials against hydrogen					
Material	generated Ion	Standard potential	Material	generated Ion	Standard potential
Lithium	Li ⁺	-3.04 V	Cobald	Co ²⁺	-0.28 V

Table 16: Electro-chemical voltage series / standard potentials against hydrogen

OPERATION OF LIQUID-COOLED DEVICES

5.1.4 Requirements on the coolant

The requirements on the coolant are depending on the ambient conditions, as well as from the used cooling system. General requirements on the coolant:

Requirements	Description
Suspended particles	The size and the proportion of suspended particles in the cooling water should not exceed the following values: < 100 μm < 10 mg per liter.
pH-value	Aluminum is particularly corroded by lixiviums and salts. The optimal pH value for aluminum should be in the range of 7.5... 8.0.
Abrasive substances	Abrasive substances as used in abrasive (quartz sand), clogging the cooling circuit.
Copper cuttings	Copper cuttings can attach the aluminum and this leads to a galvanic corrosion. Copper should not be used together with aluminum due to electro-chemical voltage difference.
Hard water	The cooling water may not cause scale deposits or loose excretions. The total hardness should be between 7...20 $^{\circ}\text{dH}$, the carbon hardness at 3...10 $^{\circ}\text{dH}$.
Soft water	Soft water (< 7 $^{\circ}\text{dH}$) corrodes the material.
Frost protection	An appropriate antifreeze must be used for applications when the heat sink or the coolant is exposed temperatures below zero. Use only products of one manufacturer for a better compatibility with other additives. We recommend the antifreeze AntifrogenN from the company Clariant with a maximum volume fraction of 52 %.
Corrosion protection	Additives can be used as corrosion protection. In combination with frost protection the corrosion protection must have a concentration of 20...25 Vol %, in order to avoid a change of the additives.

Table 17: Requirements on the coolant

5.1.5 Requirements for open and half-open cooling systems

Requirement	Measure
Impurities	Mechanical impurities in half-open cooling systems can be counteracted when appropriate water filters are used.
Salt concentration	The salt content can increase through evaporation at half-open systems. Thus the water is more corrosive. Adding of fresh water and removing of process water works against.
Algae and myxobacteria	Algae and myxobacteria can arise caused by increased water temperature and contact with atmospheric oxygen. The algae and myxobacteria clog the filters and obstruct the coolant-flow. Biocide containing additives can avoid this. Especially at longer OFF periods of the cooling circuit preventive maintenance is necessary.
Organic materials	The contamination with organic materials must be kept as small as possible, because separate slime can be caused by this

Table 18: Requirements for open and half-open cooling systems

NOTICE

Damages at the unit which are caused by clogged, corroded heat sinks or other obvious operating errors, leads to the loss of the warranty claims.

5.1.6 Coolant temperature

- The flow temperature may not exceed 40 °C.
- The maximum overheat temperature is 60 °C, 73 °C or 90 °C depending on the power unit and overload capacity.
- The coolant temperature is specified in the technical data.
- Higher flow temperatures only after consultation with KEB.

The flow temperature should be chosen depending on the volume flow, so that at rated operating the heatsink temperature is always 10 K below the overheat temperature level. As a result, a sporadic shutdown is avoided.

5.1.7 Moisture condensation

High air humidity and high temperatures can lead to moisture condensation. Moisture condensation is considered to be a threat to the drive converter. The drive converter can be destroyed by any short-circuits that may occur.

NOTICE

The user must guarantee that any moisture condensation is avoided!

OPERATION OF LIQUID-COOLED DEVICES

5.1.8 Supply of temper coolant

- Supply of temper coolant is possible by using heatings in the cooling circuit for the control of the coolant temperature.
- The following dew point table shows the coolant inlet temperature as a function of ambient temperature and air humidity.

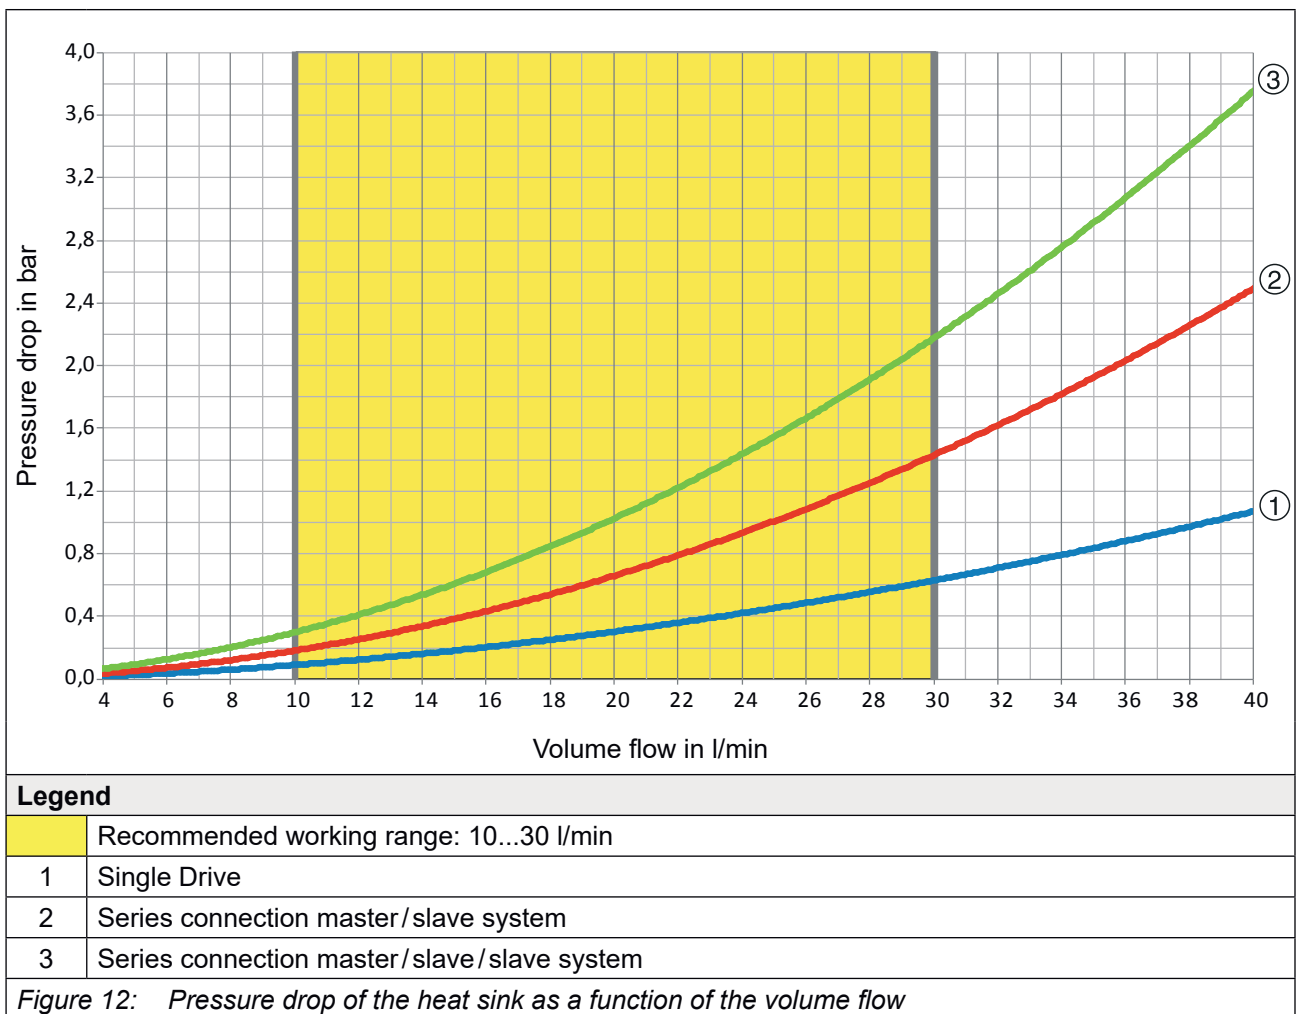

Ambient temperature in °C	Air humidity in %									
	10	20	30	40	50	60	70	80	90	100
-25	-45	-40	-36	-34	-32	-30	-29	-27	-26	-25
-20	-42	-36	-32	-29	-27	-25	-24	-22	-21	-20
-15	-37	-31	-27	-24	-22	-20	-18	-16	-15	-15

Coolant inlet temperature in °C										

Table 19: Supply of temper coolant

5.2 Diagrams of the cooling design

5.2.1 Pressure drop aluminium extrusion casting heat sink

- The curve characteristic described below is valid for 25 °C flow temperature and Antifrogen N 52 %.
- If there are higher flow temperatures, the pressure drop in the system decreases.
- This also applies to cooling medium such as water or another glycol mixture.
- A glycol mixture from Clariant in a ratio of 52 % or 33 % is recommended.

The selection of the connection diagram (series or parallel connection) of the cooling circuit depends on the total power dissipation of the drive converter system.

OPERATION OF LIQUID-COOLED DEVICES

5.2.2 Pressure drop aluminium heat sink with stainless steel tubes

- The curve characteristic described below is valid for 25 °C flow temperature and Antifrogen N 52 %.
- If there are higher flow temperatures, the pressure drop in the system decreases.
- This also applies to cooling medium such as water or another glycol mixture.
- A glycol mixture from Clariant in a ratio of 52 % or 33 % is recommended.

NOTICE

Only parallel connection of the coolant circuit is permissible for aluminium heat sinks with stainless steel tubes.

5.2.3 Series connection of liquid coolers

- Volume flow as a function of total power dissipation and temperature difference.
- The diagram below applies to the series connection of liquid coolers.

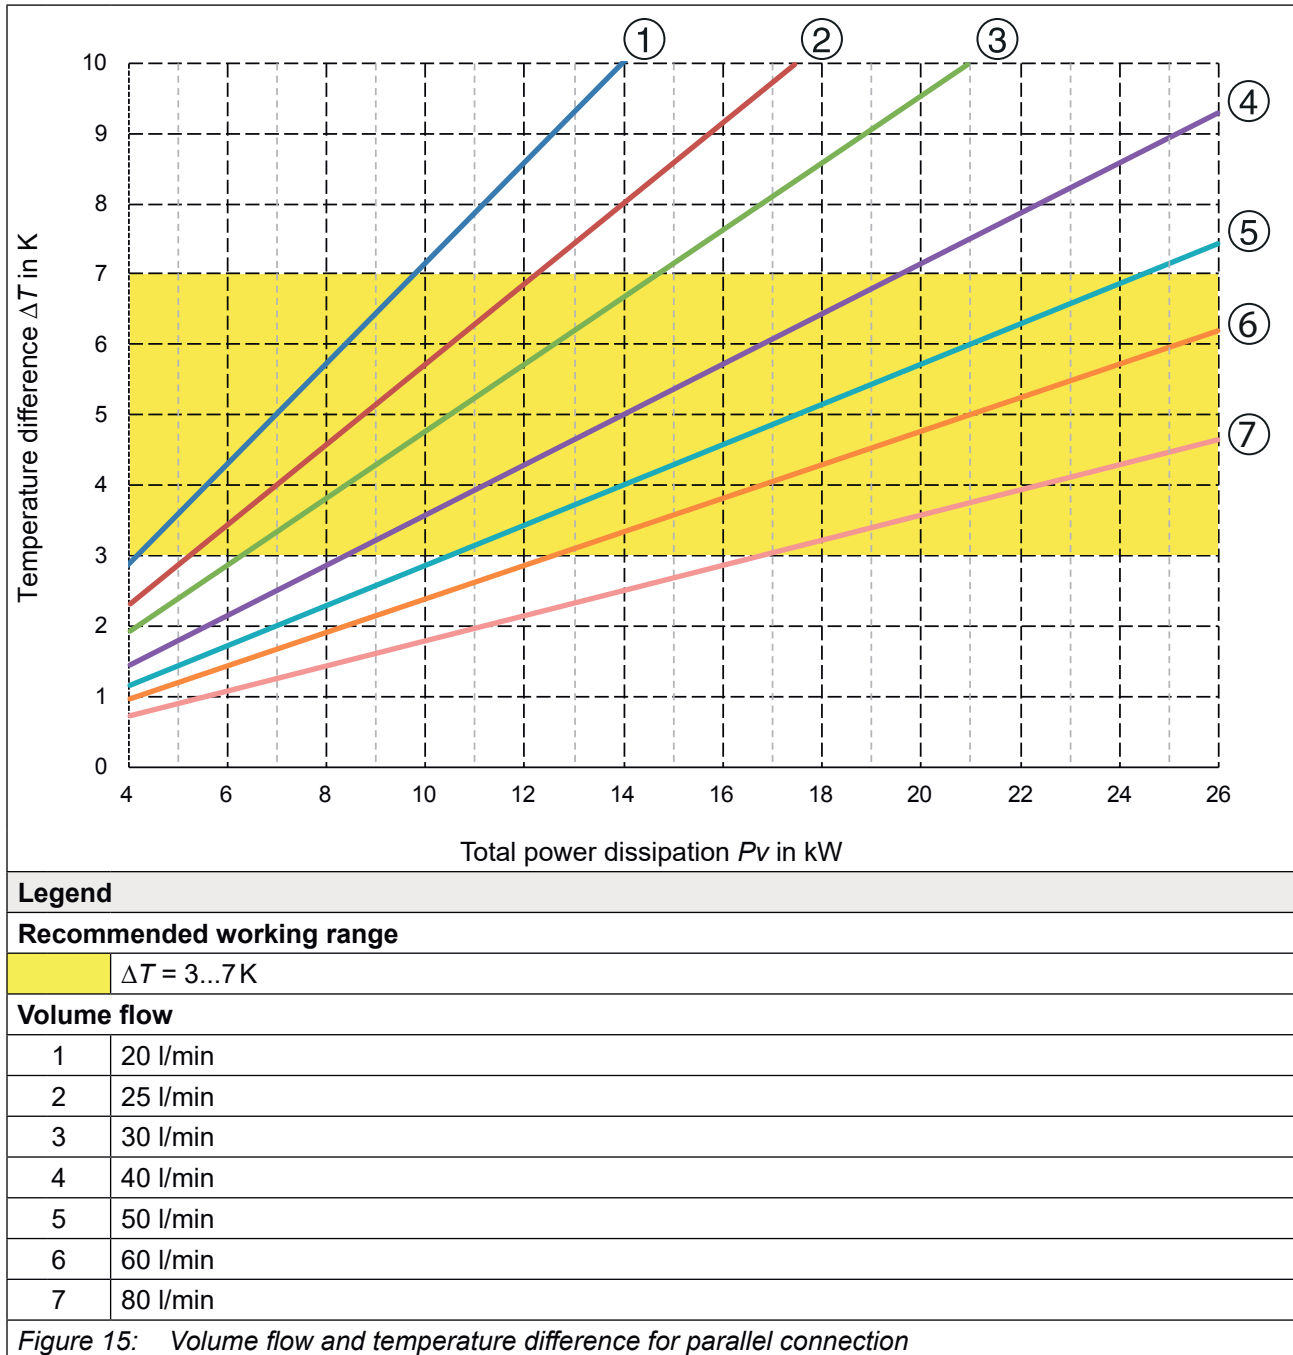

NOTICE

Series connection of liquid-cooled devices with stainless steel tubes is not permitted, since the total system pressure can increase above 10 bar.
=> "Pressure drop aluminium heat sink with stainless steel tubes".

OPERATION OF LIQUID-COOLED DEVICES

5.2.4 Parallel connection of liquid coolers

- Volume flow as a function of total power dissipation and temperature difference.
- The diagram below applies to the parallel connection of liquid coolers.

- The points 1...7 are each based on the total volume flow of the drive converter system.
- The total volume flow should be divided by the number of modules. The determined value for the volume flow is set for each module by means of throttle valves.

6 Electrical Installation

6.1 General information

This chapter contains the information which must be observed when selecting the wires, the protective measures and wiring in the control cabinet.

NOTICE

Current laws and local regulations must always be observed when planning and carrying out the installation. KEB assumes no liability for installations where laws, local and / or other regulations have not been complied with. If the recommendations given by KEB are not observed, you might experience problems when using the drive converter which are not covered by the warranty.

The specified "*Cable cross-sections*" are recommendations for dimensioning and serve as guide values for multicore copper cables. They are valid for a maximum ambient temperature of 40 °C and for open installation. This must be considered accordingly in case of deviating ambient conditions and local regulations.

6.1.1 Wiring

- Lay noise-affected or noise sensitive cables as far apart from each other as possible (minimum 200 mm).
- If the distance cannot be maintained, additional shielding measures must be provided.
- Cables must be routed as closely as possible to earthed housing parts, mounting plates or cabinet frames. This reduces noise emissions and noise injections.
- Crossings of cables of different classes are to be tolerated, parallel laying should be avoided.
- If another laying is not possible, cross the cables at right angles, especially if the signals are sensitive and interference emitted.
- Cores of signal and data lines that are not used must be earthed at both ends.
- Avoid long lines and interference sources in order to prevent additional coupling points.
- Ground unused lines on one side in the control cabinet.
- Establish ground connections with the largest possible cross-section to other control cabinets, system components and decentralized devices.
- Avoid larger conductor loops.

Figure 16: Laying the cables

6.1.2 Connection of the shield connection

- Cable shields must not be used for power supply.
- A cable shield must not assume the function of an N or PE conductor.
- Always lay cable shields over a large surface.
- Do not extend the cable shield by unshielded wire connections to the earthing point. This reduces the shielding effect by up to 90 %.
- Lay the cable shield over a large surface directly after the entry point of the control cabinet.

6.1.3 Connection of the protective earth

- The drive converter or the control cabinet in which the drive converter is installed must be connected to protective earth at the installation site.
- Use a protective earth conductor that corresponds at least half the cross-section of the cables used to supply the power terminals.
- An earthing stud is provided at the drive converter for connecting the motor protective earth.
- The resistance of the protective earth should be 0.1 Ω or less.
- According to *EN 61800-5-1*, the minimum cross-section of the protective earth conductor must comply with the local safety regulations for protective earth conductors for equipment with high leakage current.

⚠ WARNING

Indirect contact

Only with a correctly connected protective earth conductor the device fulfills the requirements for protection against indirect contact.

6.2 Connection terminals power unit

Terminal	Function	No. ¹⁾
L1, L2, L3	Mains connection	1
U, V, W	Motor connection

4	10	0.6	5.3

Figure 18: External fan power supply

6.3 Mains connection

NOTICE

Exchanging mains and motor connection leads to immediate destruction of the unit.

6.3.1 Note about hard mains

The service life of drive converters with DC link depends on the DC voltage level, the ambient temperature and the current load of the electrolytic capacitors in the DC link. The use of mains chokes can significantly increase the service life of the capacitors, especially under permanent drive load (continuous duty) or when connecting to „hard“ power systems.

The term "hard" power system means that the nodal point power (S_{net}) of the mains is very high ($\gg 200$) compared to the output rated power of the drive converter (S_{out}).

$$k = \frac{S_{net}}{S_{out}} \gg 200$$

6.3.2 Recommended type of mains cable

	<p>Symmetrical shielded cables are recommended for high motor power.</p> <ul style="list-style-type: none"> • Type of cable: 2XSLCYK-J. • The protective earth conductor is tripartited and uniformly placed between the phase lines. • Compliance with the requirements according to EN 12502-1...5.
--	--

Figure 19: Cross-section type of mains cable

6.4 Motor connection

6.4.1 General instructions

- The motor cables must be designed to the maximum continuous current.
- They are valid for 0...100 Hz (up to 300 Hz the cable losses increase by approx. 25 % due to the skin effect).
- The IGBT modules cause high-frequency interferences, the longer the motor cable length the higher the discharge to the earth potential.
- The consequence is an increase of conducted interferences on the mains side.
- If the motor cables are too long, damping of the mains filters is no longer sufficient and the permissible interference limits are exceeded.
- At the output of the drive converter, pulses of approximately 1.35-fold of the mains voltage and very short rise times are generated independently of the output frequency.
- This is the case for all drive converters with modern IGBT inverter technology.
- The voltage of the pulses can almost double at the motor connections depending on the characteristics of the motor cable.
- This can lead to additional load of the motor and the motor cable insulation.
- Modern speed-controlled drives with their fast rising voltage pulses and high switching frequencies can cause current pulses through the motor bearings which can gradually damage the bearing raceways.

NOTICE

Protect motor against voltage peaks !

- ▶ The connecting-up instructions of the motor manufacturer are generally valid.
- ▶ Drive converter switch at the output with a high rate of voltage rise. Voltage peaks that endanger the insulation system at the motor can occur especially in case of long motor cables (> 15 m). A motor choke, a dv/dt filter or sine-wave filter can be used to protect the motor.

6.4.2 Selection of the motor cable

Correct selection and laying of the motor cable is very important for high motor ratings:

- Smaller load of the motor bearings by bearing currents.
- Improved EMC characteristics.
- Lower symmetrical operating capacities.
- Less losses by transient currents.
- Due to the high currents, shielded motor cables can be connected in parallel between drive converter and motor.
- All three phases must passing through each shielded motor cable.
- The required cross-section is described in section => "[Cable cross-sections](#)".
- To keep asymmetry as small as possible, all motor cables should have the same length.
- The shielding must be placed always with large surface on both sides (mounting plate and motor housing).

6.4.3 Recommended type of the motor cable

Symmetrical shielded cables are recommended for high motor power.

- Type of cable: 2XSLCYK-J.
- The protective earth conductor is tripartited and uniformly placed between the phase lines.
- Compliance with the requirements according to [EN 12502-1...5](#).

Figure 20: Cross-section type of the motor cable

6.4.4 Connection of the motor

As a standard the connection of the motor must be carried out in accordance with the following table:

230/400 V motor		400/690 V motor	
230 V	400 V	400 V	690 V
Delta	Star	Delta	Star

Table 21: Connection of the motor

The connecting-up instructions of the motor manufacturer are generally valid!

6.4.5 Calculation of the motor voltage

The motor voltage for dimensioning of the drive is depending on the used components. The mains voltage reduces according to the following table:

Component	Reduction / %	Example:
Mains choke U_k	4	Closed-loop drive converter with mains and motor choke on a non-rigid supply system: $400\text{ V mains voltage} - 15\% = 340\text{ V motor voltage}$
Drive converter open-loop	4	
Drive converter closed-loop	8	
Motor choke U_k	1	
Non-rigid supply system	2	

Table 22: Example of motor voltage calculation

ELECTRICAL INSTALLATION

6.4.6 Cable cross-sections

The motor cable cross-section depends

- on the form of the output current (e.g. non-sinusoidal)
- on the real effective value of the motor current.
- on the cable length.
- on the type of used cable.
- on ambient conditions such as bundling and temperature.

Rated cross-section in mm ²	Rated current ¹⁾ in A
50	168
70	207
95	250
120	292
150	335
185	382
240	453

Table 23: Cable cross-sections

¹⁾ Valid for multicore cables. The factors for ambient temperature, parallel cable laying, current carrying capacity and laying factor are not taken into consideration for the technical data of the current.

6.4.7 Motor cable lengths

NOTICE

The permissible cable length is reduced if the minimum cross-section of the motor connection is distributed across several cables.

- The maximum cable lengths are specified for the recommended type of cable.
- The permissible cable lengths depend on the number of cables per phase.
- Longer cables may only be provided after consultation with KEB.
- The specified cable lengths represent the actual distance between drive converter and motor.

In case of parallel connection of motor cables, the cable capacitance is doubling, which leads to higher leakage currents between drive converter and motor. These should always be kept as small as possible.

The resulting motor cable length for parallel operation of motors, or parallel installation with multiple cables arises from the following formula:

$$\text{Resulting motor cable length} = \sum \text{single cable lengths} \times \sqrt{\text{Number of motor cables}}$$

Maximum permissible motor cable lengths			
Number of cables per phase	Ring crimp connector	Cable lengths in m	
		Without sine-wave filter / motor choke	With sine-wave filter
1	M12	100	500
2		35	177

Table 24: Maximum permissible motor cable lengths

6.5 DC connection

6.5.1 General instructions

- The DC connection terminals of the device can be used for power supply or power consumption.
- Appropriate external DC fuses must be designed by the system manufacturer.
- If external devices shall be connected to master / slave systems, the DC links must be connected with DC fuses. => *“Wiring Diagrams”*.
- DC operating voltage range [U_{dc}] for 400 / 690 V mains voltages. => *“Technical Data”*.
- The maximum permanent current carrying capacity of the DC terminals is 580 A.
- DC fuses can be found in chapter => *“Protection of drive converters”*.
- Chapter => *“Technical Data”* contains information on the DC input current for each device size at rated operation.
- The available current for external devices depends on the size of the device and the motor power output.

NOTICE

The maximum input power per module is 395 kVA. Exceeding this limit will destroy the device.

6.6 Temperature detection T1, T2

Parameter In.17 displays in high byte the installed temperature input of the drive converter. The KEB COMBIVERT F5/F6 is delivered as standard with switchable PTC/KTY evaluation. The desired function is adjusted with Pn.72 (dr33 at F6) and operates in accordance with the following table:

In.17	Function of T1, T2	Pn.72 (dr33)	Resistance	Display ru.46 (F6 => ru28)	Error/Warning ¹⁾
5xh	KTY84	0	< 215 Ω	Detection error 253	x
			498 Ω	1°C	- ²⁾
			1 kΩ	100°C	x ²⁾
			1.722 kΩ	200°C	x ²⁾
			> 1811 Ω	Detection error 254	x
	PTC (according to EN 60947-8)	1	< 750 Ω	T1-T2 closed	-
			0.75...1.65 kΩ (reset resistance)	T1-T2 closed	-
			1.65...4 kΩ (tripping resistance)	T1-T2 open	x
			> 4 kΩ	T1-T2 open	x
6xh	PT100	-			

Table 25: Temperature detection T1, T2

¹⁾ The column is valid at factory setting. The function must be programmed accordingly with parameters Pn.12, Pn.13, Pn.62 and Pn.72 for F5 in operating mode GENERAL.

²⁾ Disconnection is depending on the adjusted temperature in Pn.62 (F6 => pn11/14).

The behaviour of the drive converter in case of error/warning is defined with parameters Pn.12 (CP.28), Pn.13 (F6 =>pn12/13).

Dependent on the application the temperature input can be used for the following functions:

Function motor temperature display	Mode (F5 => Pn.72; F6 => dr33)
Motor temperature display and monitoring	KTY84
Motor temperature monitoring	PTC
Temperature control for liquid-cooled motors ¹⁾	KTY84
General fault sensing	PTC

Table 26: Function motor temperature display

¹⁾ If the temperature input is used for other functions, the motor temperature control at liquid-cooled drive converters can be done indirectly via the liquid cooling circuit of the drive converter.

NOTICE

- Do not lay KTY or PTC cable of the motor (also shielded) together with control cable!
- KTY or PTC cable only permissible with double shielding within the motor cable!

ELECTRICAL INSTALLATION

6.6.1 Use of the temperature input in KTY mode

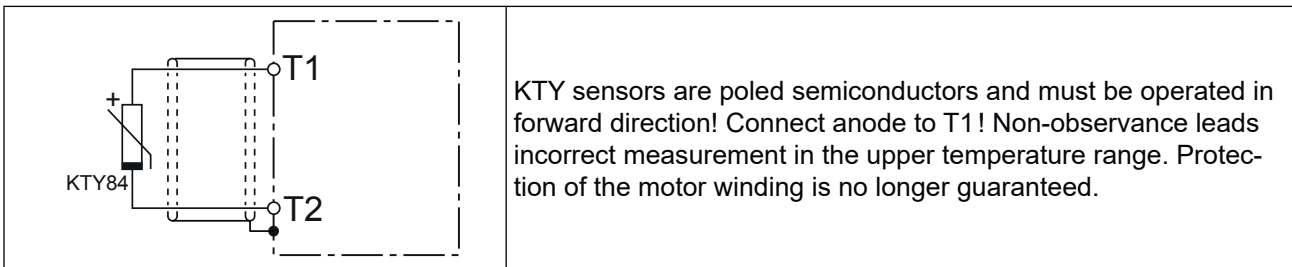

Figure 21: Connection of a KTY sensor

NOTICE

KTY sensors may not be combined with other devices. Otherwise wrong measurements would be the consequence.

Examples for the construction and programming of a temperature control with KTY84 evaluation can be taken from the F5 application manual.

6.6.2 Use of the temperature input in PTC mode

If the temperature input is operated in PTC mode, all possibilities are available for the user within the specified resistance range. This can be:

Thermal contact (NC contact)	
Temperature sensor (PTC)	
Mixed sensor chain	

Figure 22: Wiring example in PTC mode

The function can be switched off with Pn.12="7" (CP.28) if no evaluation of the input is desired (standard in operating mode GENERAL). Alternatively a bridge can be installed between T1 and T2.

6.7 Connection of a braking resistor

⚠ CAUTION

Braking resistors dissipate the produced energy of the motor into heat during generative operation.

Burns and fire risk due to high surface temperatures.

- ▶ Pay attention to appropriate protection against contact and fire.
- ▶ The mains voltage must always be switched off in case of a defective braking transistor (fire risk).
- ▶ If direct contact cannot be avoided due to structural reasons, affix the warning "Hot surfaces".

⚠ DANGER

Regenerative operation

Risk of death due to electric shock!

The drive converter remains in operation in spite of switched off power supply in regenerative operation.

- ▶ An error must be released by external wiring which switches the modulation off in the drive converter. This can occur e.g. at terminals T1/T2 or via digital input.
- ▶ The drive converter must be programmed accordingly in each case.

The use of a KEB regenerative unit is reasonable for applications which produce a lot of regenerative energy. Regeneration of excess energy into the mains.

6.7.1 Monitoring braking transistor

General

- The function "monitoring braking transistor" is standard for housing P with braking option.
- It must be wired according to the wiring diagrams.
- This circuit offers a direct protection in case of a defective braking transistor.
- If the braking transistor is defective, a relay opens the terminals K1/K2.
- Terminals K1/K2 are integrated into the holding circuit of the coupling relay for the input contactor, so the mains voltage is switched off in error case.
- Regenerative operation is also secured by the internal fault disconnection.
- Chapter => "*Wiring Diagrams*" contains examples of how to wire the integrated relay via terminals K1/K2.

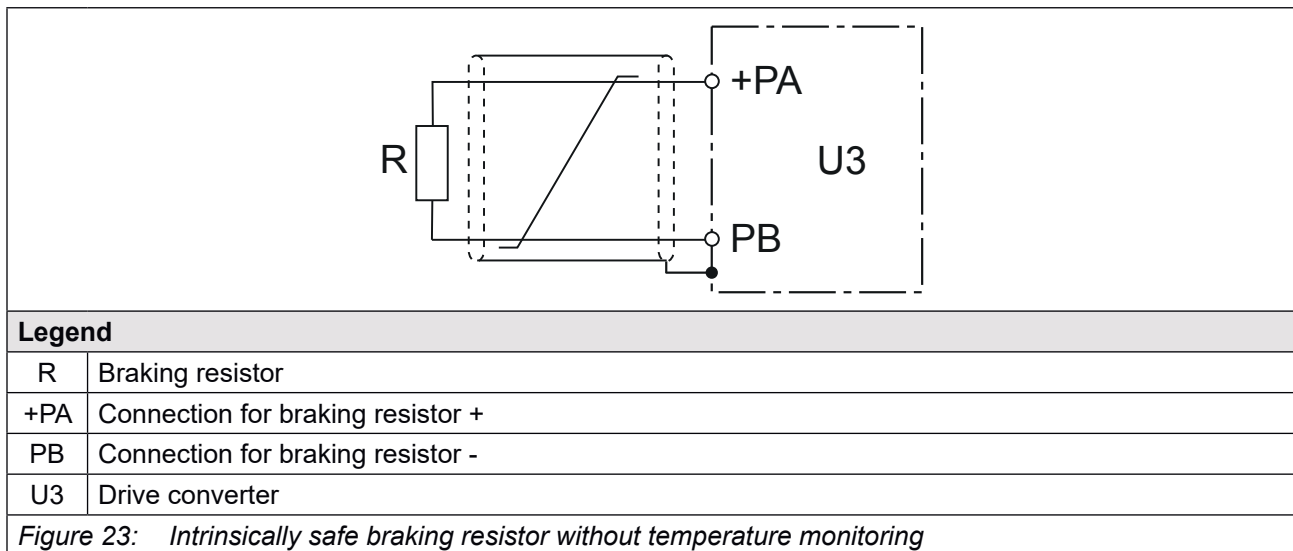

6.7.2 External braking resistor without temperature monitoring

External braking resistors are available for air-cooled and liquid-cooled devices.

NOTICE

Only "intrinsically safe" braking resistors are permissible for operation without temperature monitoring.

An intrinsically safe braking resistor will melt internally like a fuse in case of overload due to overheating. There is no short circuit or earth fault. As a result, the drive converter changes to "Error! Overvoltage" with the next deceleration process (when the braking resistor is required).

Technical data and design of intrinsically safe braking resistors.

www.keb.de/fileadmin/media/Manuals/dr/ma_dr_safe-braking-resistors-20106652_de.pdf

6.7.3 External braking resistor with overtemperature protection

Chapter => “*Wiring Diagrams*” contains examples how to connect external braking resistors with overtemperature protection.

Technical data and design of non-intrinsically safe braking resistors.

www.keb.de/fileadmin/media/Manuals/dr/ma_dr_braking-resistors-20116737_de.pdf

6.7.4 Sub-mounted braking resistors without overtemperature protection

- Sub-mounted braking resistors are only available for liquid-cooled devices.
- Terminal PB is not available for this device version.

NOTICE

Sub-mounted braking resistors are not suitable to convert large amounts of regenerative energy into heat. They are intended to intercept regenerative peaks.

6.8 Temperature switch braking resistor, mains and motor choke

6.8.1 General instructions

The following must be observed when wiring the temperature switches of the braking resistor, mains and motor choke:

- All cables must be laid separately from each other.
- If the various temperature switches are connected in series, EMC interference from the motor side can be coupled back to the input. => “*Wiring*”.
- Chapter => “*Wiring Diagrams*” contains examples of how the temperature switches are connected to the control board.
- The used digital inputs must be parameterized to external error.

6.8.2 Parameterization of the control board

Device series	Parameter	Description	Function	Default value
F5	di.02	digital input selection	set inputs	112 I2+I2+I3 ¹⁾
	di.11	I1 function external error 8192	external error	8192
	di.12	I2 function external error 8192		
	di.13	I3 function external error 8192		
F6	di.00	digital inputs logic	set inputs	7 I2+I2+I3 ¹⁾
	pn.30	prog. error	source set inputs	7 I2+I2+I3

Table 27: Parameterization of the control board

¹⁾ Depending on the number of the used inputs.

ELECTRICAL INSTALLATION

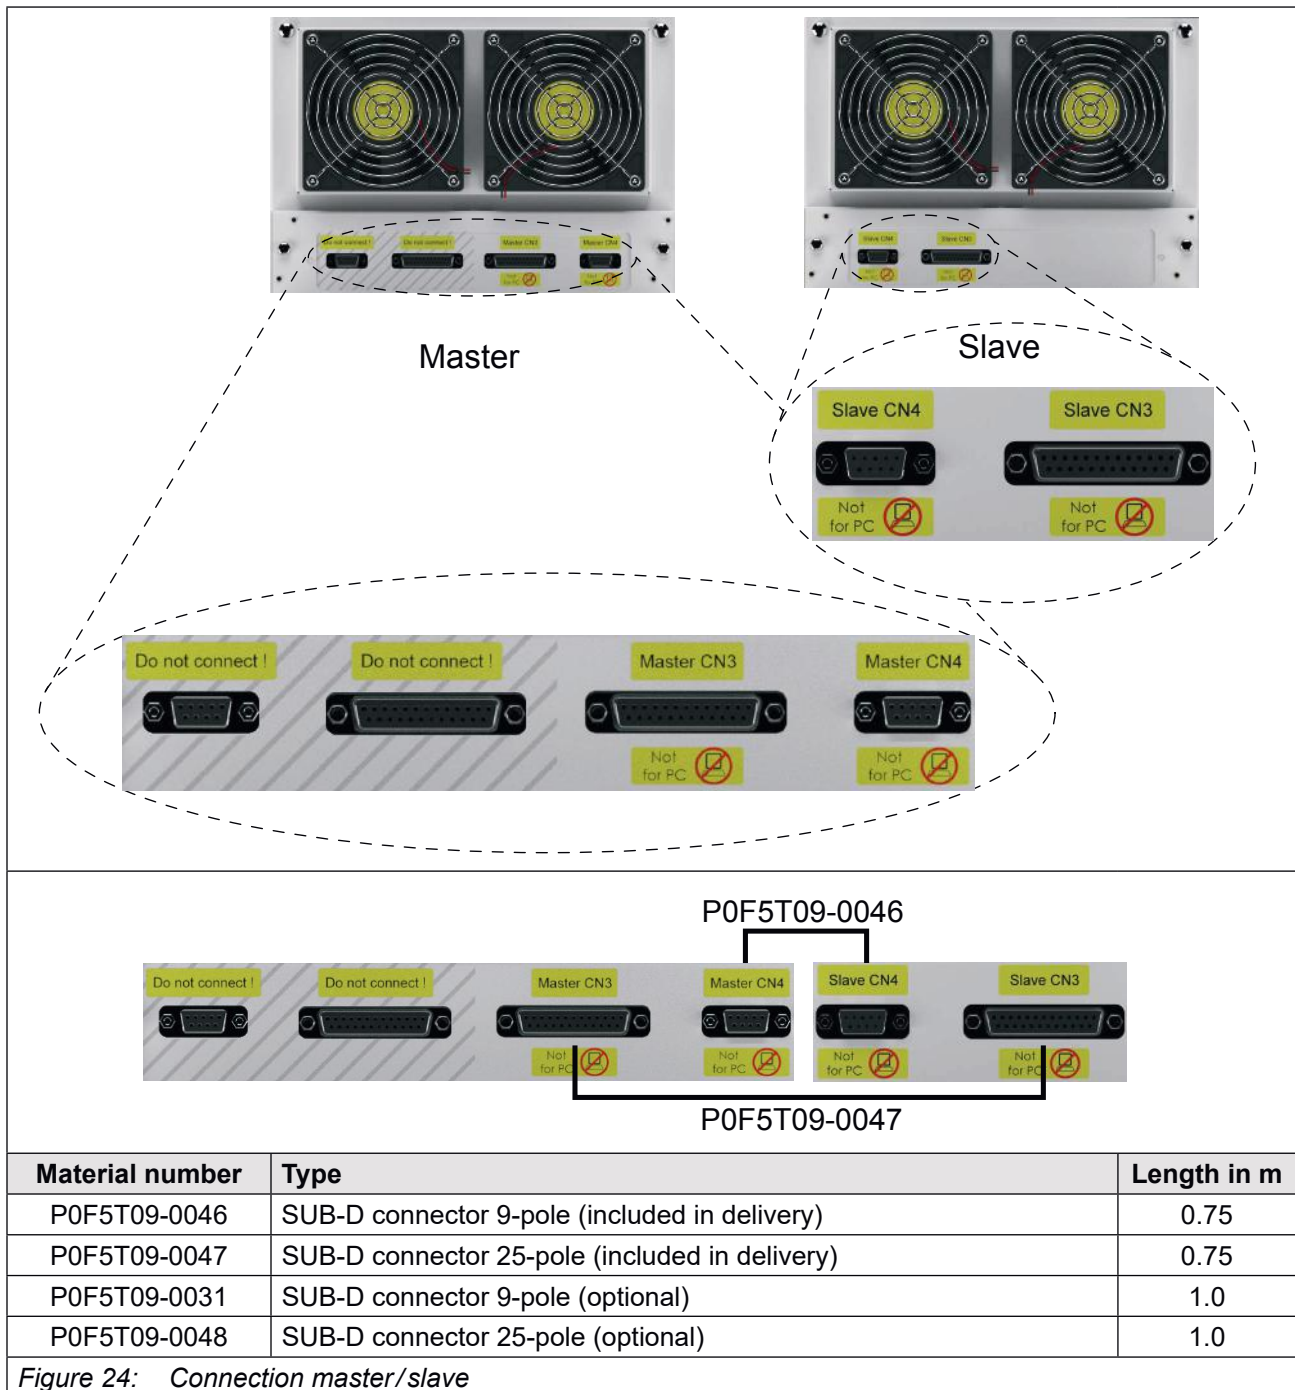

6.9 Connection of the master/slave wiring

6.9.1 Connection master/slave

- Make sure that the SUB-D connection is connected correctly.
- Tighten SUB-D connectors.

NOTICE

Do not ground SUB-D cable between master and slave!

Figure 25: Master/slave connections

The connection cables can be attached to the supplied cable clamps using cable ties.

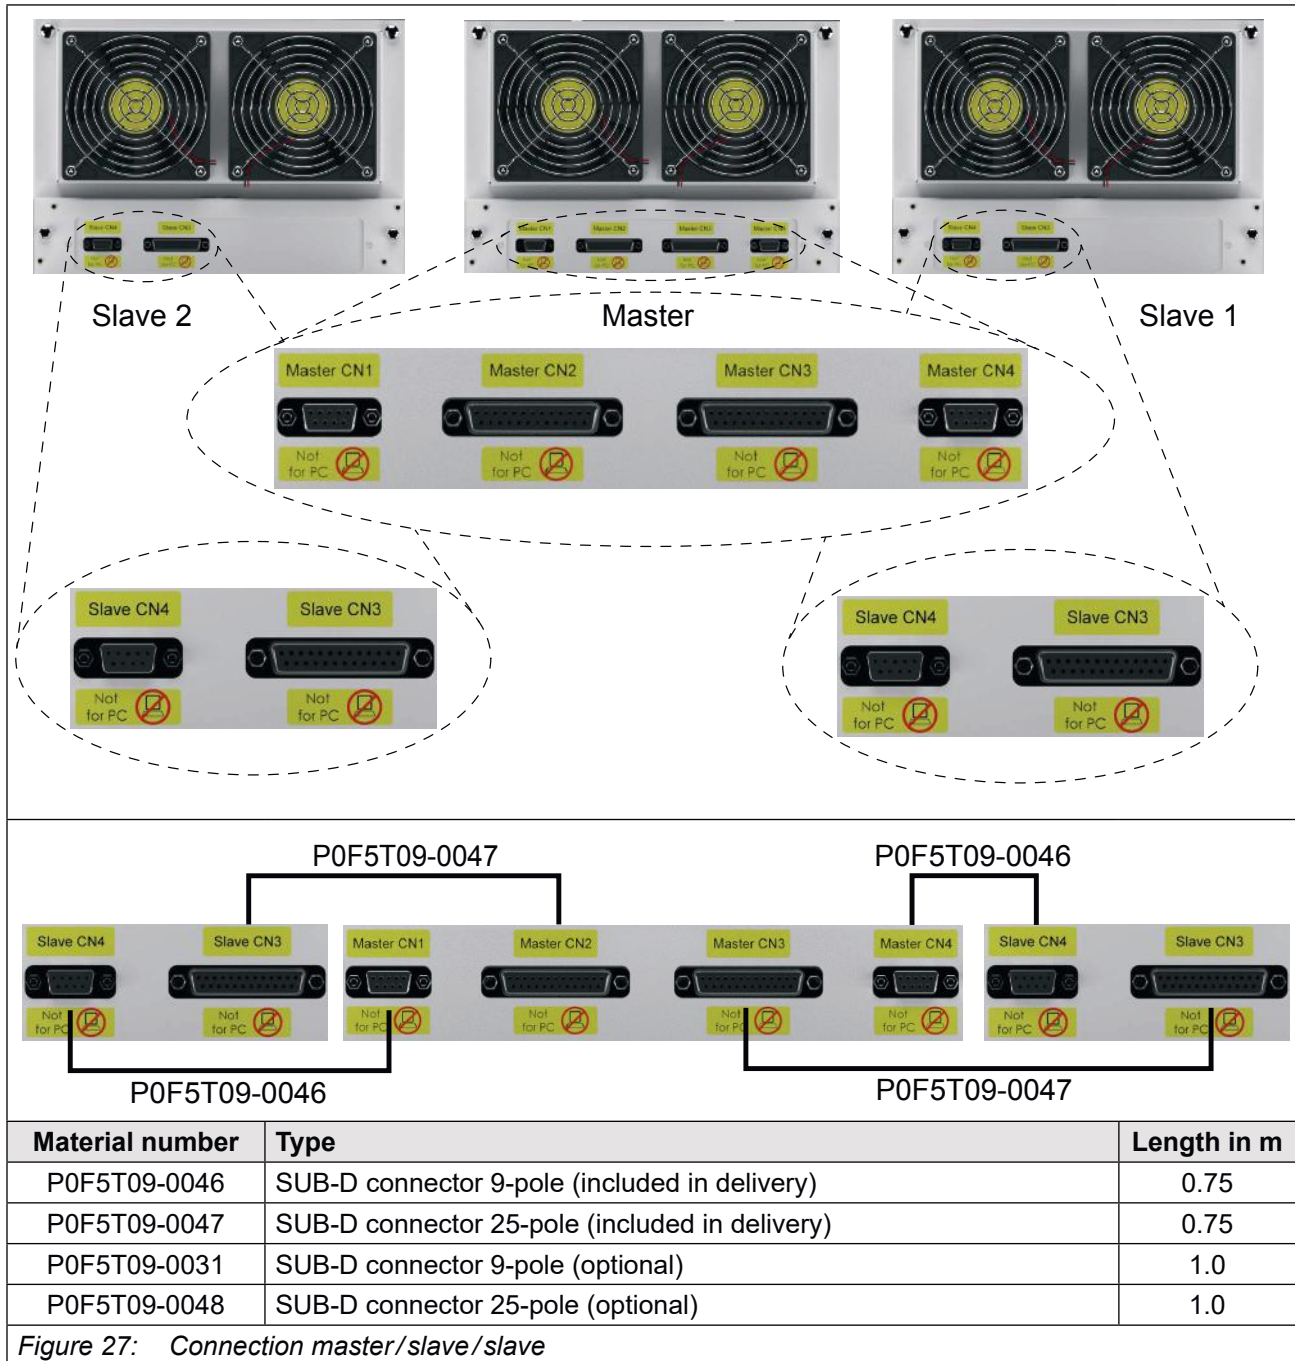

Figure 26: Cable clamps master/slave connections

ELECTRICAL INSTALLATION

6.9.2 Connection master/slave/slave

NOTICE

Do not ground SUB-D cable between master and slave!

Table 29: Use of circuit breakers

9 Certification

9.1 CE Marking

CE marked drive converters and servo drives were developed and manufactured to comply with the regulations of the Low-Voltage Directive and EMC Directive. The harmonized standards of the series *EN 61800-5-1* and *EN 61800-3* were used.

For more information about the CE declarations of conformity.

=> *"Further informations and documentation"*.

9.2 UL Marking

Acceptance according to UL is marked at KEB drive converters with the adjacent logo on the nameplate.

To be conform according to UL for the use on the North American and Canadian Market the following instructions must be observed (original text of the UL):

- Control Board Rating (max. 30Vdc, 1A)
- „Maximum Surrounding Air Temperature 45°C“
- Degree of Overload Protection provided internally by the Drive, in percent of full load current.
- Devices are intended for use in pollution degree 2 environment
- Wiring Terminals marked to indicate proper connections for the power supply, load and control circuit.
- „Use 75°C Copper Conductors Only“
- Terminals - Torque Value for Field Wiring Terminals, the value to be according to the R/C or Unlisted Terminal Block used.
- Input/Output connections - „Input/output Studs/Nuts shall be connected with UL Listed Ring Connectors (ZMVV/ZMVV7) rated 600V and suitable ampere rating (min. 125% of Input/Output Currents). The tightening torque value of the Nuts needs to be 310 lb-in. (35 Nm)“
- Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the Manufacturer Instructions, National Electrical Code and any additional local codes.
- These devices do not incorporate an internal solid state motor overload protection and are intended to be used with motors having thermal protectors in or on the motors.

In order to comply with CSA C22.2 No. 14-2010 (cUL) following external Filters and Mains Chokes manufactured by KEB Automation KG need to be installed:

Voltage class	Inverter size / Mod.	Filter		Mains choke		Alt. Choke		
400/480 V	28/1	1	x	28E4T60-1001	1	x	28Z1B04-1000	28Z1B05-1002

Table 30: External filters and chokes

Detailed wiring Instructions for the external Filters and Mains Chokes as specified are present in the Installation Instructions of the products.

Short Circuit rating and Branch Circuit Protection:

All 480 V Models:

Suitable For Use On A Circuit Capable Of Delivering Not More Than 100kA rms Symmetrical Amperes, 480 Volts Maximum when Protected by Class J or RK5 Fuses, rated ___ Amperes

or when Protected by A Circuit Breaker Having an Interrupting rating Not Less than 100kA rms Symmetrical Amperes, 480V maximum, rated ___ Amperes

CERTIFICATION

Table I Branch Circuit Protection of inverter series F5/F6 – P – housing:

a) Class J or RK5 Fuses as specified below:

Inverter F5/F6	Input Voltage [V]	UL 248 Fuse type J or RK5 [A]
28	480 / 3ph	3x400
29	480 / 3ph	3x500
29	480 / 3ph	2 x 3x300
30	480 / 3ph	3x600
30	480 / 3ph	2 x 3x350
32	480 / 3ph	2 x 3x400
32	480 / 3ph	3 x 3x300
33	480 / 3ph	2 x 3x450
33	480 / 3ph	3 x 3x350
34	480 / 3ph	2 x 3x500
34	480 / 3ph	3 x 3x400
35	480 / 3ph	2 x 3x600
35	480 / 3ph	3 x 3x400
36	480 / 3ph	3 x 3x500
37	480 / 3ph	3 x 3x600
38	480 / 3ph	3 x 3x600

Table 31: UL fuses

b) Inverse Time Circuit Breaker as specified below:

Inverter	Input Voltage [V]	UL 489 MCCB [A]	Siemens Cat. No.
28	480 / 3ph	400	3VL400/JG-frame
29	480 / 3ph	600	3VL400X/LG-frame
29	480 / 3ph	2 x 400	2x 3VL400/JG-frame
30	480 / 3ph	600	3VL400X/LG-frame
30	480 / 3ph	2 x 400	2x 3VL400/JG-frame
32	480 / 3ph	2 x 400	2x 3VL400/JG-frame
32	480 / 3ph	3 x 400	3x 3VL400/JG-frame
33	480 / 3ph	2 x 600	2x 3VL400X/LG-frame
33	480 / 3ph	3 x 400	3x 3VL400/JG-frame
34	480 / 3ph	2 x 600	2x 3VL400X/LG-frame
34	480 / 3ph	3 x 400	3x 3VL400/JG-frame
35	480 / 3ph	2 x 600	2x 3VL400X/LG-frame
35	480 / 3ph	3 x 400	3x 3VL400/JG-frame
36	480 / 3ph	3 x 500	3x 3VL400X/LG-frame
37	480 / 3ph	3 x 600	3x 3VL400X/LG-frame
38	480 / 3ph	3 x 600	3x 3VL400X/LG-frame

Table 32: Cable protection switch

9.3 Further informations and documentation

You find supplementary manuals and instructions for the download under www.keb.de/de/service/downloads

General instructions

- EMC and safety instructions
- Manuals for further control boards

Instruction and information for construction and development

- Input fuses in accordance with UL
- Programming manual for control and power unit
- Motor configurator to select the appropriate drive converter and to create downloads for parameterizing the drive converter

Approvals and approbations

- Declaration of conformity CE
- TÜV certificate
- FS certification

Others

- COMBIVIS, the software for comfortable parameterization of drive converters via PC (available per download)
- EPLAN drawings

10 Characteristics

10.1 Overload characteristic

Figure 39: Overload characteristic

On exceeding a load of 105% the overload integrator starts. When falling below the integrator counts backwards. If the integrator achieves the overload characteristic that corresponds to the drive converter, error E.OL is triggered.

10.2 Overload protection in the lower speed range

Applies only to operating modes MULTI and SERVO.

Figure 40: Overload protection in the lower speed range

A PT1 element (t=280ms) starts if the permissible current is exceeded. After its sequence of operation the error E.OL2 is triggered.

10.3 Power dissipation of the 400V class at rated operation

The following diagram shows the total power dissipation as a function of the output current per module at

- different switching frequencies.
- 50 Hz output frequency.
- 25 °C ambient temperature.

10.3.1 Power dissipation of different switching frequencies

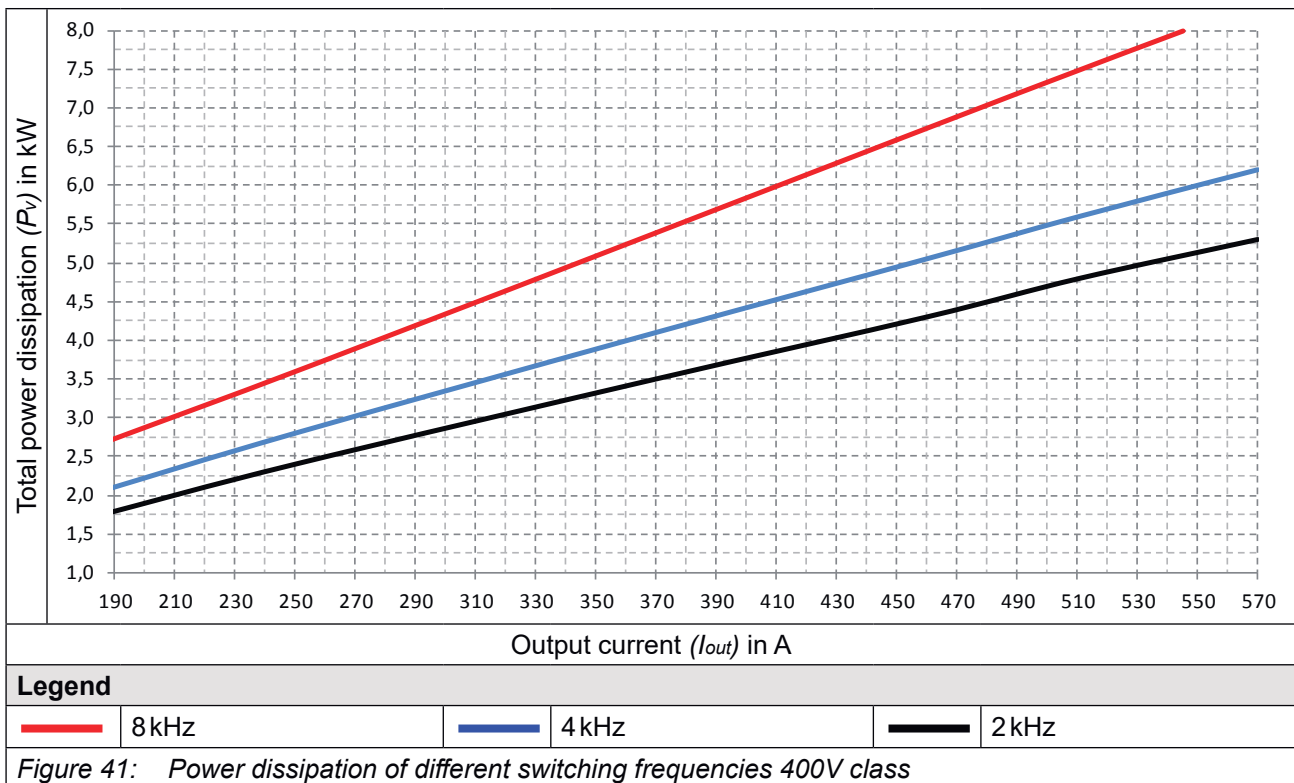

Figure 41: Power dissipation of different switching frequencies 400V class

Determination of power dissipation with parallel connected modules:

- ▶ Divide the output current by the number of modules.
- ▶ Determine the power dissipation from the upper diagram with the determined output current for a module.
- ▶ Multiply the power dissipation with the number of modules.

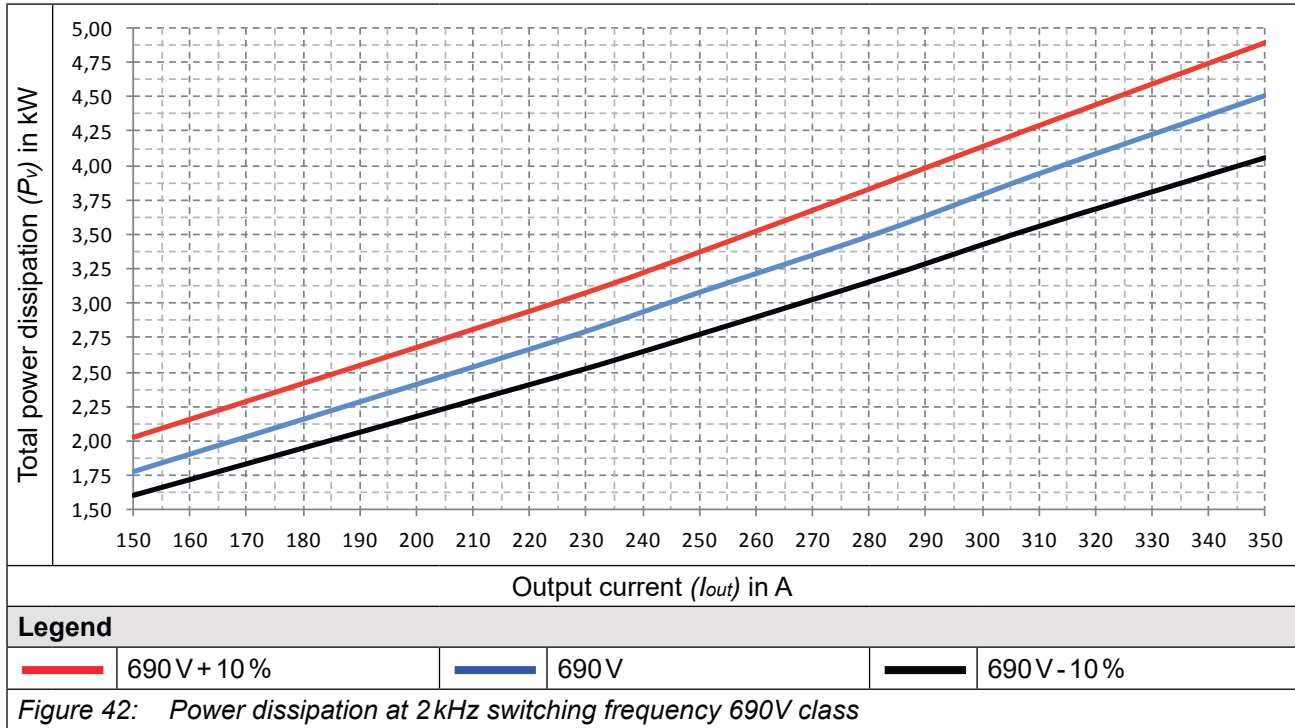

CHARACTERISTICS

10.4 Power dissipation of the 690V class at rated operation

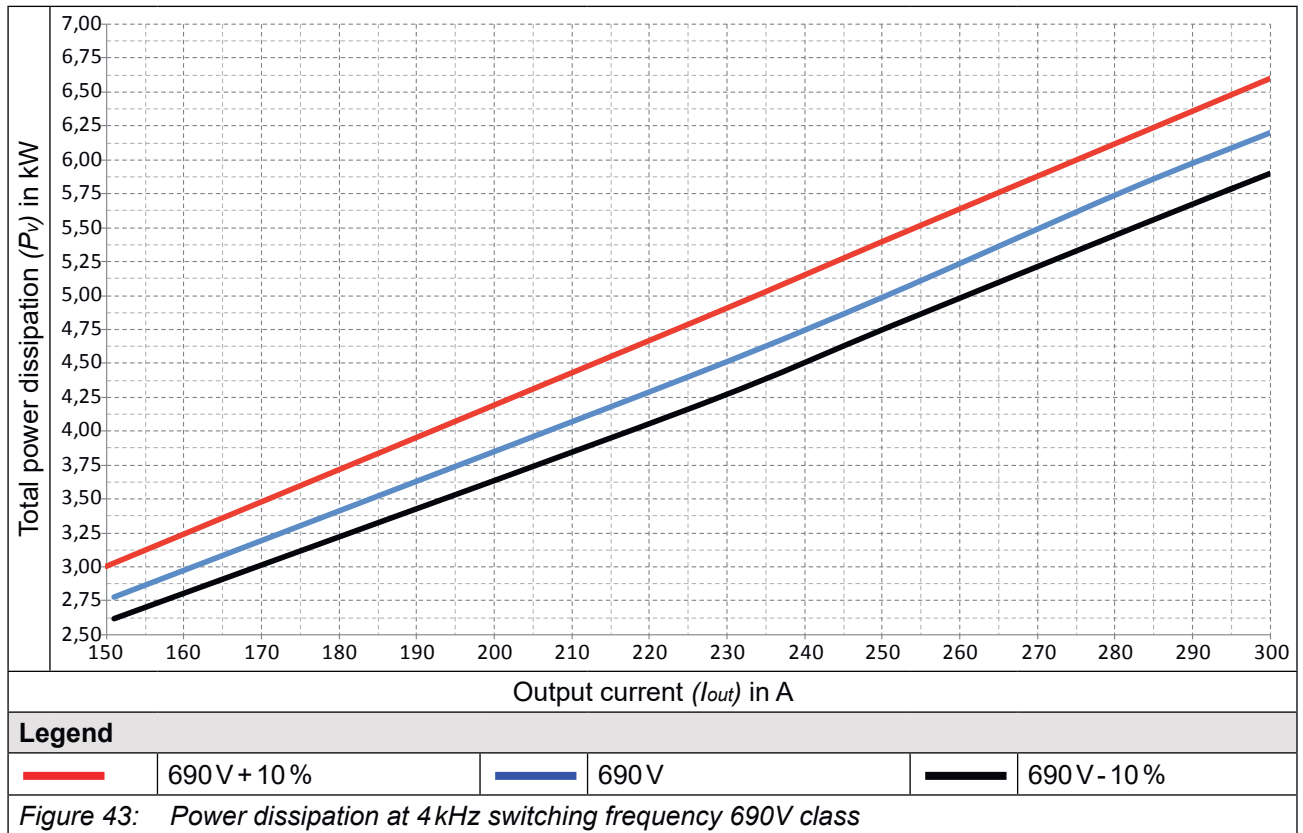

The following diagram shows the total power dissipation as a function of the output current per module at

- 50 Hz output frequency.
- 25°C ambient temperature.

10.4.1 Power dissipation at 2 kHz switching frequency

10.4.2 Power dissipation at 4 kHz switching frequency

ACCESSORIES

REVISION HISTORY

12 Revision History

Revision	Date	Description
2A	2011-04	First published version
2B	2011-11	Technical datas, dimensions, connection of the power circuit, braking resistor and annex C are overworked
2C	2012-01	Master/ slave wiring changed
2D	2012-04	Cooling water directive und water connection revised
2E	2012-04	Use of the temperature input in KTY mode revised
2F	2012-06	Braking resistor adapted to standard series; Shielding for temperature sensors; Master / slave wiring
2G	2013-01	EMC and safety instructions changed
2H	2014-09	Transport instructions inserted
2I	2014-09	UL values added to technical data
2J	2015-03	Revision of the technical data; Fuse values inserted; Coolant diagrams adapted
00	2018-10	change to document number; complete revision of the content
01	2020-05	Mounting of the housing in the control cabinet defined; Editorial changes
